-  **365 Days** Free Update
-  **800,000+** Satisfied Customers

### QUESTION 1

Which statement is true about Oracle Cloud Infrastructure FastConnect?

- A. For private peering, FastConnect extends your existing infrastructure to allow you to consume object storage from your on-premises data center
- B. For private peering, FastConnect extends your existing infrastructure to a virtual cloud network
- C. The FastConnect provider network offers only 1 Gbps port connection speed increments
- D. For public peering, a dynamic routing gateway must be configured and attached to the virtual cloud network (VCN)

Correct Answer: B

With FastConnect, you can choose to use private peering public peering , , or both.

Private peering: To extend your existing infrastructure into a virtual cloud network (VCN) in Oracle Cloud Infrastructure (for example, to implement a hybrid cloud, or a lift and shift scenario). Communication across the connection is with IPv4 private addresses (typically RFC 1918).

Public peering: To access public services in Oracle Cloud Infrastructure without using the internet. For example, Object Storage, the Oracle Cloud Infrastructure Console and APIs, or public load balancers in your VCN. Communication across the connection is with IPv4 public IP addresses. Without FastConnect, the traffic destined for public IP addresses would be routed over the internet.

---

### QUESTION 2

Which three are valid Terraform configuration components? (Choose three.)

- A. variable
- B. region
- C. metadata
- D. instance
- E. resource
- F. data source

Correct Answer: AEF

---

### QUESTION 3

Which statement is true about a pre-authenticated request in Oracle Cloud Infrastructure Object Storage?

- A. You can create only 1, 000 pre-authenticated requests per bucket.
- B. You can create a pre-authenticated request only for public buckets.

- C. You cannot retire a pre-authenticated request before it expires.
- D. You cannot extend the expiration date on a pre-authenticated request.

Correct Answer: D

<https://docs.cloud.oracle.com/iaas/Content/Object/Tasks/usingpreauthenticatedrequests.htm>

You can create an unlimited number of pre-authenticated requests.

You can't edit a pre-authenticated request. If you want to change user access options in response to changing requirements, you must create a new preauthenticated request.

URL: <https://docs.cloud.oracle.com/iaas/Content/Object/Tasks/managingbuckets.htm>

You can change a bucket's access from public to private or from private to public. Changing the type of access doesn't affect existing pre-authenticated requests. Existing pre-authenticated requests still work.

---

#### QUESTION 4

Which two statements are true about Database Cloud Service (DBCS)? (Choose two.)

- A. Data Guard as a Service is offered among regions.
- B. You have full control over backup schedule and retention.
- C. You can manage Oracle parameters at a global system level.
- D. You cannot manage the database as sys/sysdba.

Correct Answer: BC

References: <https://cloud.oracle.com/database/faq#backup>

Can I set up Data Guard across Availability Domains? Yes, you can set up Data Guard in the same or different Availability Domains in a region. However, Oracle recommends that you set up your Data Guard configuration across Availability

Domains. Can I set up Data Guard across Oracle Cloud Infrastructure regions? Yes, you can set up Data Guard across regions,

"but the Database Cloud Service Data Guard feature currently does not support it. "

You can manually set up Data Guard across regions by logging on to your host and using DGMGRL. You must enable an internet gateway on the primary and standby DB system VCN for Data Guard to transport logs across regions. Learn more about DGMGRL.

To configure a Data Guard system across regions or between on-premises and Oracle Cloud Infrastructure DB systems, you must access the database host directly and use the DGMGRL utility.

## QUESTION 5

You have two NFS clients running in two different subnets within the same Oracle Cloud Infrastructure (OCI) Virtual Cloud Network (VCN). You have created a shared file system for the two NFS clients who want to connect to the same file system, but you want to restrict one of the clients to have READ access while the other has READ/Write access. Which OCI feature would you leverage to meet this requirement?

- A. Use VCN security rules to control access for the NFS clients
- B. Use OCI Identity Access Management to control access for the NFS clients
- C. Use File Storage NFS Export Options to control access for the NFS clients
- D. Use NFS security to control access for the NFS clients

Correct Answer: C

Oracle Cloud Infrastructure File Storage service provides a durable, scalable, secure, enterprise-grade network file system. You can connect to a File Storage service file system from any bare metal, virtual machine, or container instance in your Virtual Cloud Network (VCN). You can also access a file system from outside the VCN using Oracle Cloud Infrastructure FastConnect and Internet Protocol security (IPSec) virtual private network (VPN).

### EXPORT

Exports control how NFS clients access file systems when they connect to a mount target. File systems are exported (made available) through mount targets. Each mount target maintains an export set which contains one or many exports. A

file system must have at least one export in one mount target in order for instances to mount the file system. The information used by an export includes the file system OCID, mount target OCID, export set OCID, export path, and client export

options. For more information, see Managing Mount Targets.

### EXPORT SET

Collection of one or more exports that control what file systems the mount target exports using NFSv3 protocol and how those file systems are found using the NFS mount protocol. Each mount target has an export set. Each file system

associated with the mount target has at least one export in the export set.

### EXPORT PATH

A path that is specified when an export is created. It uniquely identifies the file system within the mount target, letting you associate up to 100 file systems to a single mount target. This path is unrelated to any path within the file system itself,

or the client mount point path.

### EXPORT OPTIONS

NFS export options are a set of parameters within the export that specify the level of access granted to NFS clients when they connect to a mount target. An NFS export options entry within an export defines access for a single IP address or

CIDR block range. For more information, see Working with NFS Export Options.
