

1Z0-1085-20^{Q&As}

Oracle Cloud Infrastructure Foundations 2020 Associate

Pass Oracle 1Z0-1085-20 Exam with 100% Guarantee

Free Download Real Questions & Answers **PDF** and **VCE** file from:

<https://www.leads4pass.com/1z0-1085-20.html>

100% Passing Guarantee
100% Money Back Assurance

Following Questions and Answers are all new published by Oracle
Official Exam Center

-  **Instant Download** After Purchase
-  **100% Money Back** Guarantee
-  **365 Days** Free Update
-  **800,000+** Satisfied Customers

QUESTION 1

After Signing up for a new Oracle cloud Infrastructure tenancy, what would you subscribe to in order to deploy infrastructure and services in different parts of the world?

- A. Availability Domain
- B. Fault Domains
- C. Pay as you go pricing
- D. Region

Correct Answer: D

Oracle Cloud Infrastructure is hosted in regions and availability domains. A region is a localized geographic area, and an availability domain is one or more data centers located within a region. A region is composed of one or more availability domains. Most Oracle Cloud Infrastructure resources are either region-specific, such as a virtual cloud network, or availability domain-specific, such as a compute instance. Traffic between availability domains and between regions is encrypted. Availability domains are isolated from each other, fault tolerant, and very unlikely to fail simultaneously. Because availability domains do not share infrastructure such as power or cooling, or the internal availability domain network, a failure at one availability domain within a region is unlikely to impact the availability of the others within the same region. The availability domains within the same region are connected to each other by a low latency, high bandwidth network, which makes it possible for you to provide high-availability connectivity to the internet and on-premises, and to build replicated systems in multiple availability domains for both high-availability and disaster recovery. Oracle is adding multiple cloud regions around the world to provide local access to cloud resources for our customers. To accomplish this quickly, we've chosen to launch regions in new geographies with one availability domain. As regions require expansion, we have the option to add capacity to existing availability domains, to add additional availability domains to an existing region, or to build a new region. The expansion approach in a particular scenario is based on customer requirements as well as considerations of regional demand patterns and resource availability. For any region with one availability domain, a second availability domain or region in the same country or geo-political area will be made available within a year to enable further options for disaster recovery that support customer requirements for data residency where they exist. QUESTION 2

Which capability enables you to search, purchase, and start using software in your Oracle Cloud Infrastructure (OCI) tenancy?

- A. OCI Marketplace
- B. OCI OS Management
- C. OCI Resource Manager
- D. OCI Registry

Correct Answer: A

Oracle Cloud Infrastructure Marketplace is an online store that offers solutions specifically for customers of Oracle Cloud Infrastructure. In the Oracle Cloud Infrastructure Marketplace catalog, you can find listings for two types of solutions from Oracle and trusted partners: images and stacks. These listing types include different categories of

applications. Also, some listings are free and others require payment. Images are templates of virtual hard drives that determine the operating system and software to run on an instance. You can deploy image listings on an Oracle Cloud Infrastructure Compute instance. Marketplace also offers stack listings. Stacks represent definitions of groups of Oracle Cloud Infrastructure resources that you can act on as a group. Each stack has a configuration consisting of one or more declarative configuration files. With an image or a stack, you have a customized, more streamlined way of getting started with a publisher's software.

QUESTION 3

Which Oracle Cloud Infrastructure storage service can provide a shared file system across multiple compute instances?

- A. file Storage
- B. Local NVMe
- C. Object Storage
- D. Archive storage

Correct Answer: A

Oracle Cloud Infrastructure File Storage service provides a durable, scalable, secure, enterprise-grade network file system. You can connect to a File Storage service file system from any bare metal, virtual machine, or container instance in your Virtual Cloud Network (VCN). You can also access a file system from outside the VCN using Oracle Cloud Infrastructure FastConnect and Internet Protocol security (IPSec) virtual private network (VPN). Large Compute clusters of thousands of instances can use the File Storage service for high-performance shared storage. Storage provisioning is fully managed and automatic as your use scales from a single byte to exabytes without upfront provisioning.

QUESTION 4

Which SLA type is not offered by Oracle Cloud Infrastructure compute service?

- A. Data Plane
- B. Performance Plane
- C. Service Plane
- D. Control Plane

Correct Answer: C

Service Plane is NOT an SLA provided by OCI. See the table below:

OCI services with SLA

Services	Data Plane	Control Plane	Perf.
Compute	Yes	Yes	Yes
Block Volume	Yes	Yes	Yes
File Storage	Yes	Yes	
Database - Dense I/O	Yes	Yes	
Database Cloud Service	Yes	Yes	
Database Exadata Service	Yes	Yes	
Data Safe	Yes	Yes	
Other services - API Gateway, Autonomous Data Warehouse, Autonomous Transaction Processing, Database Backup Cloud Service, Digital Assistant, DNS, Email, FastConnect, Functions, Health Checks, Integration Cloud, Key Management, Load Balancer, Monitoring, NoSQL Database Cloud, Notifications Service, Object Storage, Outbound Data Transfer, Streaming Service, Web Application Firewall	Yes

QUESTION 5

What is the frequency of OCI usage report generation?

- A. Weekly
- B. Monthly
- C. Annually
- D. Daily

Correct Answer: D

A usage report is a comma-separated value (CSV) file that can be used to get a detailed breakdown of resources in Oracle Cloud Infrastructure for audit or invoice reconciliation. The usage report is automatically generated daily, and is stored in an Oracle-owned Object Storage bucket. It contains one row per each Oracle Cloud Infrastructure resource (such as instance, Object Storage bucket, VNIC) per hour along with consumption information, metadata, and tags. Usage reports generally contain 24 hours of usage data, although occasionally a usage report may contain late-arriving data that is older than 24 hours. Usage reports are retained for one year.
