QUESTION 1

Consider the three binary log files bin.00010, bin.00011 and bin.00012 which you want to restore data from. How should you process these files when using mysqlbinlog to satisfy inter-file dependencies?

- A. shell> mysqlbinlog bin.00010 | mysqlshell> mysqlbinlog bin.00011 | mysqlshell> mysqlbinlog bin.00012 |mysql
- B. shell> mysqlbinlog bin.00010 bin.00011 bin.00012 | mysql
- C. You can use both of the above statements, i.e. process the files either in a group or separately. All inter-file dependencies will be taken care of with both methods.

Correct Answer: B

32.8.3. Processing Binary Log Contents shell> mysqlbinlog bin.000050 bin.000051 bin.000052 | mysql All the binary log files that you want to process should be handled in a single mysqlbinlog command. There may be inter-file dependencies that will not be satisfied if you process them separately.

QUESTION 2

Which of the following features are supported by MyISAM tables?

- A. Foreign key constraints
- B. Transactions
- C. Auto_increment columns
- D. Fulltext indexes
- E. Assembly of multiple MyISAM tables to a MERGE table
- F. Row level locking
- G. Table level locking

Correct Answer: CDEG

29.2. The MyISAM Engine

MyISAM has the most flexible AUTO_INCREMENT column handling of all the storage engines.

MyISAM tables can be used to set up MERGE tables.

MyISAM tables can be converted into fast, compressed, read-only tables to save space. MyISAM supports FULLTEXT searching and spatial data types.

QUESTION 3

Which of following list the default order in which option files are read on UNIX?

- A. ~/.my.cnf, \$MYSQL_HOME/my.cnf, and /etc/my.cnf
- B. /etc/my.cnf, \$MYSQL_HOME/my.cnf, and ~/.my.cnf
- C. \$MYSQL_HOME/my.cnf, /etc/my.cnf, and ~/.my.cnf
- D. ~/.my.cnf, /etc/my.cnf, and \$MYSQL_HOME/my.cnf
- E. /etc/my.cnf, ~/.my.cnf, and \$MYSQL_HOME/my.cnf

Correct Answer: B

24.4. Runtime MySQL Configuration

On Unix, the search order includes two general option files, /etc/my.cnf and \$MYSQL_HOME/my.cnf. The second file is used only if the MYSQL_HOME environment variable is set. Typically, you set it to the MySQL installation directory. (The

mysqld_safe script attempts to set MYSQL_HOME if it is not set before starting the server.)

The Unix option file search order also includes ~/.my.cnf, that is, the .my.cnf file located in the home directory of the person running the program.

QUESTION 4

When you set up per-table tablespace files for InnoDB...

- A. Shared tablespace files are not needed.
- B. Occasionally shared tablespace files are still needed.
- C. Shared tablespace files are still needed.
- D. Per-table tablespace files cannot be used with InnoDB.

Correct Answer: C

InnoDB always needs the shared tablespace because it puts its internal data dictionary and undo logs there.

The .ibd files are not sufficient for InnoDB to operate. <http://dev.mysql.com/doc/refman/5.5/en/innodb-multiple-tablespaces.html>

QUESTION 5

Which of the following statements are true for MyISAM tables?

- A. By default, write requests (such as UPDATE and DELETE statements) take priority over read requests (such as SELECT statements).
- B. By default, read requests (such as SELECT statements) take priority over write requests (such as UPDATE and DELETE statements).
- C. With the LOW_PRIORITY option, a write request will wait for any other read request to finish.

D. With the LOW_PRIORITY option, a read request will wait for any other write request to finish.

E. With the HIGH_PRIORITY option, a read request will be moved ahead of other requests waiting to be executed.

Correct Answer: ACE

29.2.1. MyISAM Locking Characteristics

By default, the server schedules queries for execution as follows:

Write requests (such as UPDATE and DELETE statements) take priority over read requests (such as SELECT statements).

The server tries to perform write requests in the order that it receives them. When working with MyISAM tables, certain scheduling modifiers are available to change the priority of requests:

The LOW_PRIORITY modifier may be applied to statements that update tables (INSERT, DELETE, REPLACE, or UPDATE). A low-priority write request waits not only until all current readers have finished, but for any pending read requests

that arrive while the write request itself is waiting. HIGH_PRIORITY may be used with a SELECT statement to move it ahead of updates and ahead of other SELECT statements that do not use the HIGH_PRIORITY modifier.
