### QUESTION 1

A developer implements an asynchronous implementation for calculating insurance proposals. The input data for the calculations is made available on a single message queue. Two types of insurance proposals will be calculated: car and

life. Message with data for other insurance types are posted on the queue but should be left on the queue by this implementation.

Which statement is true?

- A. The developer will NOT succeed because all messages will be consumed from the queue.
- B. The developer can implement a push-back mechanism if the message is of the wrong type.
- C. The developer can use a messageSelector to receive only the car and life data message if the JMS body contains selectable data.
- D. The developer can use a messageSelector to receive only the car and life data message if the header contains properties to make selection.

Correct Answer: D

A JMS message selector allows a client to specify, by header field references and property references, the messages it is interested in. Only messages whose header and property values match the selector are delivered. What it means for a message not to be delivered depends on the MessageConsumer being used (see QueueReceiver and TopicSubscriber). Reference: javax.jms Interface Message

---

### QUESTION 2

Given an JMS message-driven bean, which statement is true about its exception handling?

- A. Its message listener method must NOT throw any checked exception.
- B. Its message listener method can throw java.rmi.RemoteException.
- C. Its message listener method can throw any checked exception except java.rmi.RemoteException.
- D. Its message listener method can throw any checked exception that implements java.io.Serializable.

Correct Answer: A

---

### QUESTION 3

Which is a valid use of the EJB 3.x TimerHandle object?

- A. To retrieve all active timers associated with this bean
- B. To adapt EJB 3.x timers to EJB 2.1 and earlier timers
- C. To obtain a serializable timer handle that may be persisted

D. To be implemented by EJB classes that are to be registered with the timer service

Correct Answer: C

The TimerHandle interface allows the bean provider to obtain a serializable timer handle that may be persisted.

Since timers are local objects, a timer handle must not be passed through a bean's remote business interface, remote interface or web service interface.

Reference: javax.ejb, Interface TimerHandle

---

#### QUESTION 4

An enterprise bean has security permissions set up using declarative security features. Under which two conditions can a client be guaranteed to have permission to invoke a business method on the enterprise bean? (Choose two.)

- A. The Application Assembler has marked the enterprise bean method as unchecked.
- B. The client's principal has been assigned a security role with permission to invoke the method.
- C. The Application Assembler has set the security-identity deployment descriptor to run-as.
- D. The Application Assembler has mapped all security role references using the role-link element.

Correct Answer: AB

---

#### QUESTION 5

A developer implements a session bean which acts as a session facade for an application. This means that clients will only see this session bean's interface which offers the application interface, where are three distinct roles known at development time: "user", "admin", and "guest". The majority of the methods will be used by role "user". All methods must have role permissions active and roles may be added or changed in the future.

Which two scenarios are correct? (Choose two.)

- A. The developer annotates the bean class with @PermitAll and annotates the methods used by role "guest" or "admin" individually.
- B. The developer annotates the bean class with @DenyAll and annotates the methods used by role "user", "guest", or "admin" individually.
- C. The developer defines individual method permissions for the methods used by roles "user", "guest", and "admin" in the deployment descriptor.
- D. The developer annotates the bean class with @RolesAllowed("user") and annotates the methods used by role "guest" or "admin" individually.
- E. The developer defines a method permission with method name "\*" and role "user" and adds individual method permissions for the methods used by roles "guest" and "admin" in the deployment descriptor.

Correct Answer: DE
