QUESTION 1

You have a database availability group (DAG). The DAG is configured as shown in the following table.

Servename	Sitename	Role
EX1	Site1	Mailbox server Client Access server
EX2	Site1	Mailbox server Client Access server
EX3	Site1	Mailbox server Client Access server
EX4	Site2	Mailbox server Client Access server
EX5	Site2	Mailbox server Client Access server

You need to prevent a split-brain condition if a restore operation of the DAG occurs. What should you do?

- A. Deploy an alternate witness server to each site.
- B. Modify the Datacenter Activation Coordination (DAC) mode.
- C. Set the quorum model of the cluster to Node and Disk Majority.
- D. Deploy another Mailbox server to Site2.

Correct Answer: B

Datacenter Activation Coordination (DAC) mode is a property setting for a database availability group (DAG). DAC mode is disabled by default and should be enabled for all DAGs with two or more members that use continuous replication. If a catastrophic failure occurs that affects the DAG (for example, a complete failure of one of the datacenters), DAC mode is used to control the startup database mount behavior of a DAG. When DAC mode isn't enabled and a failure occurs that affects multiple servers in the DAG, and then when a majority of the DAG members are restored after the failure, the DAG will restart and attempt to mount databases. In a multi-datacenter configuration, this behavior could cause split brain syndrome, a condition that occurs when all networks fail, and DAG members can't receive heartbeat signals from each other. Split brain syndrome can also occur when network connectivity is severed between datacenters. Split brain syndrome is prevented by always requiring a majority of the DAG members (and in the case of DAGs with an even number of members, the DAG's witness server) to be available and interacting for the DAG to be operational. When a majority of the members are communicating, the DAG is said to have quorum.

QUESTION 2

You have a server named Server1 that has Exchange Server 2013 installed.

Users access their mailbox by using Microsoft Outlook 2010 and Outlook Web App.

You enable auditing for all of the mailboxes.

You need to identify when a mailbox is accessed by someone other than the owner of the mailbox.

What are two possible ways to achieve this goal? (Each correct answer presents a complete solution. Choose two.)

- A. Export the administrator audit log.
- B. Run an administrator role group report.
- C. Export the mailbox audit log.
- D. Run a non-owner mailbox access report.
- E. Review the security event log.

Correct Answer: CD

C: Use the Auditing tab to run reports or export entries from the mailbox audit log and the administrator audit log. / The mailbox audit log records whenever a mailbox is accessed by someone other than the person who owns the mailbox. This

can help you determine who has accessed a mailbox and what they have done.

/ The administrator audit log records any action, based on a Windows PowerShell cmdlet, performed by an administrator. This can help you troubleshoot configuration issues or identify the cause of security- or compliance-related problems.

D: Run a Non-Owner Mailbox Access Report

Use this report to find mailboxes that have been accessed by someone other than the person who owns the mailbox.

QUESTION 3

You have a hybrid deployment of Exchange Server 2013 and Microsoft Office 365. The Exchange Server organization has a mailbox size limit of 2 GB.

You need to provide engineers with the ability to retain certain email messages indefinitely. The solution must meet the following requirements:

Ensure that the engineers can access the retained email messages by using Outlook Web App.

Ensure that the retained email messages do not apply to the mailbox size limit of the engineers.

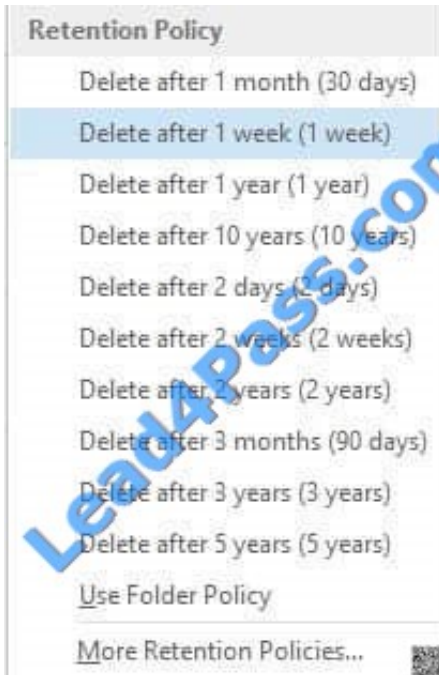

Minimize the storage requirements of the on-premises servers.

Which two actions should you perform? (Each correct answer presents part of the solution. Choose two.)

- A. From Office 365, create Archive mailboxes.
- B. Instruct the engineers to create a personal folder.
- C. Create a retention policy.
- D. From the on-premises Exchange Server 2013 organization, create Archive mailboxes.
- E. Create a data loss prevention (DLP) policy.

Correct Answer: AC

C:

A:

In Exchange Server an archive mailbox is a second mailbox provisioned for a user that is separate to their primary user mailbox.

QUESTION 4

Your company has offices in Montreal, New York, and Toronto.

Each office is configured as an Active Directory site. The Montreal office has a site link to the New York office. The New York office has a site link to the Toronto office.

You have an Exchange Server 2013 organization that contains five Mailbox servers. The organization is configured as shown in the exhibit. (Click the Exhibit button.)

The servers in the Montreal and Toronto offices are members of a database availability group (DAG) named DAG01. DAG01 contains two databases name TOMBX and MTLMBX.

MTLMBX is active on EX1 and contains all of the mailboxes of the users in the Montreal office.

TOMBX is active on EX3 and contains all of the mailboxes of the users in the Toronto office.

You need to ensure that all email messages transmitted between the Montreal users and the Toronto users are routed through EX5.

Which two actions should you perform? (Each correct answer presents part of the solution.

Choose two.)

- A. Run the Set-MailboxTransportService cmdlet on EX5.
- B. Make EX5 the source server for all of the Send connectors.
- C. Create a separate DAG for each of the Montreal and Toronto offices.
- D. Add EX5 to DAG01.
- E. Configure the New York office as a hub site.

Correct Answer: CE

Routing in Exchange 2013 is now fully aware of Database Availability Groups (DAGs), and uses DAG membership as a routing boundary. You use the Set-AdSite cmdlet to specify an Active Directory site as a hub site. Whenever a hub site exists along the least-cost routing path for message delivery, the messages are queued and are processed by the Transport service on Mailbox servers in the hub site before they're relayed to their ultimate destination. You can configure any Active Directory site as a hub site. However, for this configuration to work correctly, you must have at least one Mailbox server in the hub site.

QUESTION 5

You need to recommend a solution for the voice mail traffic. The solution must meet the technical requirements.

Which two configurations should you include in the recommendation? (Each correct answer presents part of the solution. Choose two.)

- A. A dial plan.
- B. A server certificate
- C. A transport rule
- D. A data loss prevention (DLP) policy
- E. A call answering rule

Correct Answer: AB
