QUESTION 1

An organization plans to migrate to Office 365. You use the Windows Azure Active Directory (AD) Sync tool.

Several users will not migrate to Office 365. You must exclude these users from synchronization. All users must continue to authenticate against the on-premises Active Directory.

You need to synchronize the remaining users.

Which three actions should you perform? Each correct answer presents part of the solution.

- A. Populate an attribute for each user account.
- B. Disable the user accounts in Active Directory.
- C. Perform a full synchronization.
- D. Configure the connection filter.
- E. Run the Windows PowerShell command `Set-MSolDirSyncEnabled -EnableDirSync $false`.

Correct Answer: ACD

To implement user attribute-based Directory synchronization filtering you need to add an attribute to each user object that is to be filtered in your on-premises Active Directory. Then you need to enable Active Directory synchronization filtering and configure the connection filter to use the user attribute. Finally, you must perform a full synchronization.

QUESTION 2

An organization plans to deploy Exchange Online.

You must support all Exchange Online features.

You need to create the required DNS entries.

Which two DNS entries should you create? Each correct answer presents part of the solution.

- A. A
- B. SRV
- C. MX
- D. CNAME

Correct Answer: CD

C: The MX record is used to send incoming mail for your domain to the Exchange Online service in Office 365.

D: The CNAME record is used to help Outlook clients to easily connect to the Exchange Online service by using the Autodiscover service. Autodiscover automatically finds the correct Exchange Server host and configures Outlook for users.

QUESTION 3

Contoso Ltd. uses Office 365 for collaboration. You are implementing Active Directory Federation Services (AD FS) for single sign-on (SSO) with Office 365 services. The environment contains an Active Directory domain and an AD FS federation server.

You need to ensure that the environment is prepared for the AD FS setup.

Which two actions should you perform? Each correct answer presents part of the solution.

- A. Configure Active Directory to use the domain contoso.com.
- B. Configure Active Directory to use the domain contoso.local.
- C. Create a server authentication certificate for the federation server by using fs.contoso.com as the subject name and subject alternative name.
- D. Create a server authentication certificate for the federation server by using fs.contoso.local as the subject name and subject alternative name.

Correct Answer: AC

A: The domain we want to federate must be registered as a public internet domain with a domain registrar or within our own public DNS servers. We cannot use contoso.local as it is not routable outside of the intranet.

C: The Subject Name of the SSL certificate must match the names used in the AD FS configuration. The default sub-domain for AD FS is fs. As we use contoso.com as the domain, we are probably using fs,contoso.com as the AD FS name and we must also use it in the subject name for the certificate.

QUESTION 4

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.

After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

Your network contains a single Active Directory forest. The forest contains a domain controller and Active Directory Federation Services (AD FS) servers that are deployed to virtual machines. The virtual machines run either on-premises or on

Microsoft Azure.

You have Azure AD Connect deployed on-premises. The Azure AD Connect database is installed on an on-premises instance of Microsoft SQL Server 2014.

Last month, an Azure AD Connect server experienced a hardware failure that caused an Azure AD Connect server to go offline for several days.

You need to recommend a solution to reduce the outage window when hardware failure occurs on the Azure AD Connect server.

Solution: You deploy a new on-premises Azure AD Connect server that uses the same SQL Server instance. You start Azure AD Connect sync.

Does this meet the goal?

- A. Yes
- B. No

Correct Answer: B

An on-premises Azure AD Connect server already exists. A server in staging mode is required to provide High Availability. References: <https://azure.microsoft.com/en-us/documentation/articles/active-directory-aadconnectsync-operations/>

QUESTION 5

Your company has a hybrid deployment of Office 365. All mailboxes are hosted on Office 365. All users access their Office 365 mailbox by using a user account that is hosted on-premises. You need to delete a user account and its associated mailbox.

Which tool should you use?

- A. The Remove-MSOLUser cmdlet
- B. The Remove-Mailbox cmdlet
- C. The Office 365 portal
- D. Active Directory Users and Computers

Correct Answer: D

With directory synchronization enabled, the on-premise Active Directory becomes the master for all changes to the synchronized mail-enabled objects in Microsoft Azure Active Directory. You should thus delete accounts from Active Directory and when directory synchronization runs the associated object will be deleted from Azure and the associated mailbox will be soft-deleted.
