QUESTION 1

Your network contains an Active Directory domain named contoso.com. The domain has Microsoft System Center 2012 Configuration Manager deployed.

All client computers run Windows XP.

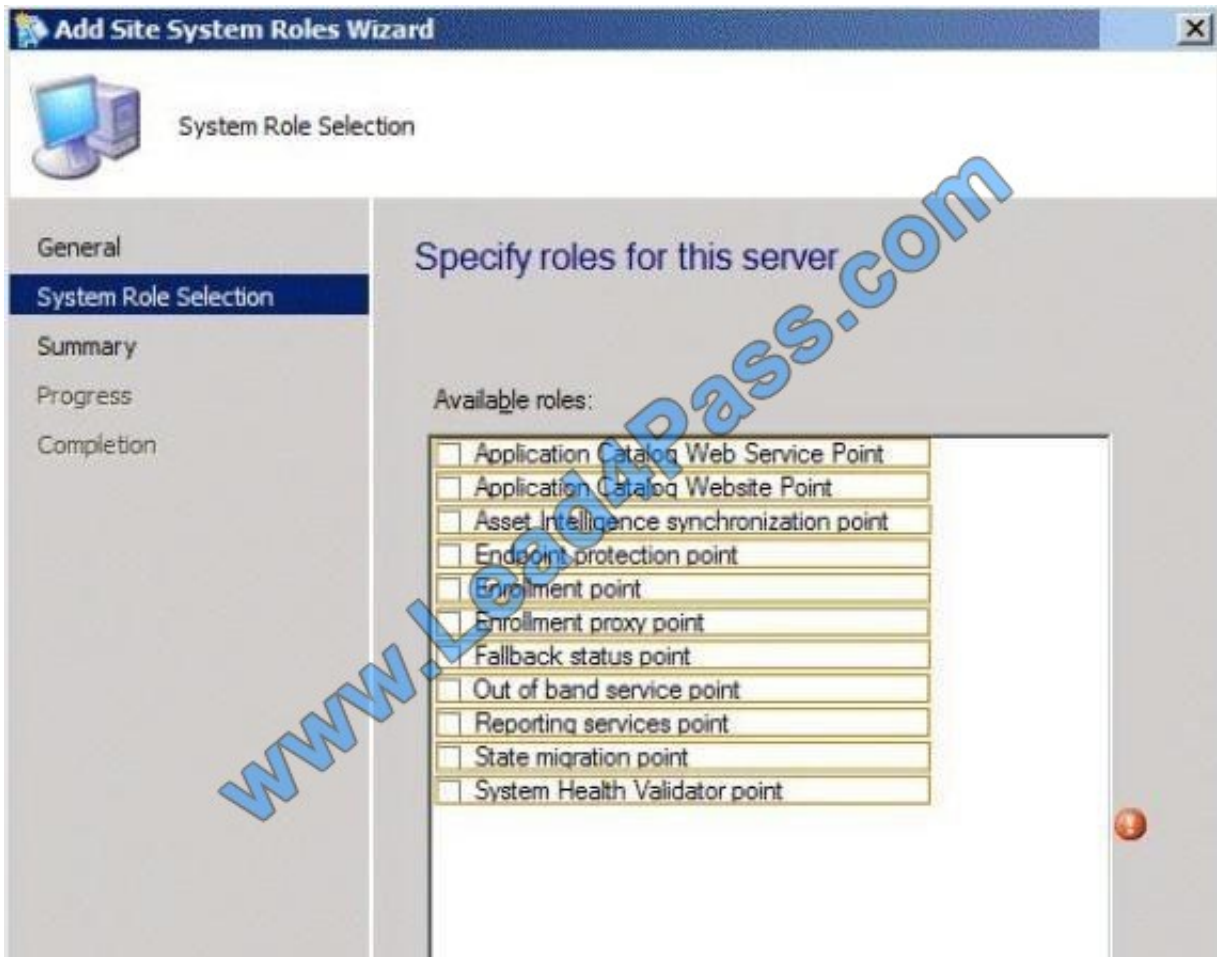

Your company plans to replace all of the client computers with new computers that run Windows 8.

You need to recommend which Configuration Manager system role must be deployed to capture the local application data from the Windows XP computers, and then deploy the local application data to the Windows 8 computers.

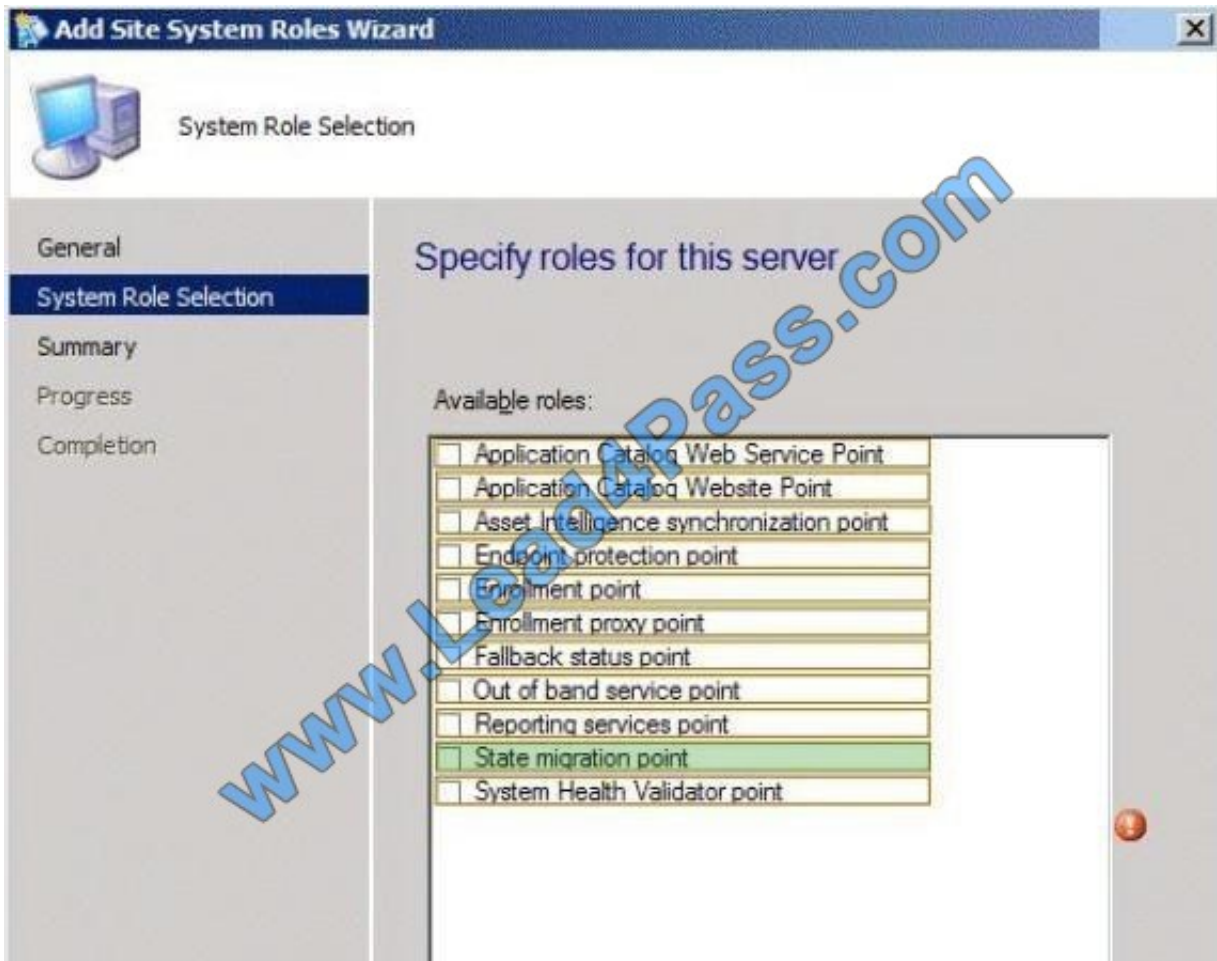

Which system role should you recommend?

To answer, select the appropriate system role in the answer area.

Hot Area:

Correct Answer:

QUESTION 2

Your network contains an Active Directory domain named contoso.com. The domain contains a server named Server1 that has Microsoft System Center 2012 Configuration Manager installed.

Configuration Manager has all of the system roles enabled.

The domain contains 500 client computers that run Windows XP.

You need to install Windows 8 on all of the client computers by running a full installation from a Configuration Manager task sequence.

The solution must meet the following requirements:

All user state data must be copied to a secure network location before the installation of Windows 8.

All user state data must be retained on the network after the installation of Windows 8.

Which five actions should you include in the task sequence?

To answer, move the five appropriate actions from the list of actions to the answer area and arrange them in the correct order.

Select and Place:

Actions	Answer Area
Capture the operating system image.	
Capture the user files and settings.	
Enable BitLocker Drive Encryption (Bitlocker).	
Apply the Network settings.	
Restore the user files and settings.	
Request the user state storage.	

Correct Answer:

Actions	Answer Area
	Capture the operating system image.
	Request the user state storage.
Enable BitLocker Drive Encryption (Bitlocker).	Capture the user files and settings.
	Apply the Network settings.
	Restore the user files and settings.

Box 1:

There are three basic actions that you must take when you want to use Configuration Manager to deploy an operating system image to a collection of one or more destination computers:

1. Build and capture an image and distribute it to distribution points.
2. Create and configure the task sequence that installs the operating system image.
3. Deploy the task sequence.

Box 2:

* When you deploy operating systems, you can save the user state from the destination computer, deploy the operating system, and then restore the user state after the operating systems is deployed. This process is typically used when you

upgrade the operating system on a Configuration Manager client computer.

The user state information is captured and restored by using task sequences.

* To capture and restore the user state, you must first create a task sequence, and then edit the task sequence to add

the following task sequence steps:

Request State Store: This step is needed only if you store the user state on the state migration point.

Capture User State: This step captures the user state data and stores it on the state migration point or locally using links.

Restore User State: This step restores the user state data on the destination computer. It can retrieve the data from a user state migration point or from the destination computer.

Box 3:

Box 4: Use the Apply Network Settings task sequence step to specify the network or workgroup configuration information for the destination computer.

QUESTION 3

Your network contains an Active Directory domain named contoso.com. The domain has Remote Desktop Services (RDS) deployed. The domain contains six servers. The servers are configured as shown in the following table.

Server name	Configuration
Server1	Remote Desktop Session Host (RD Session Host)
Server2	Remote Desktop Session Host (RD Session Host)
Server3	Remote Desktop Connection Broker (RD Connection Broker)
Server4	Remote Desktop Web Access (RD Web Access)
Server5	Microsoft SQL Server 2008 R2
Server6	None

You plan to configure Server6 as an additional RD Connection Broker in the RDS deployment.

You need to identify which servers require the SQL Server Native Client installed.

Which servers should you identify? (Each correct answer presents part of the solution. Choose all that apply.)

- A. Server1
- B. Server2
- C. Server3
- D. Server4
- E. Server5
- F. Server6

Correct Answer: BE

QUESTION 4

Your network contains an Active Directory domain named contoso.com.

You plan to implement Encrypting File System (EFS) to encrypt data on the client computer of each user.

You need to prevent EFS from generating self-signed certificates.

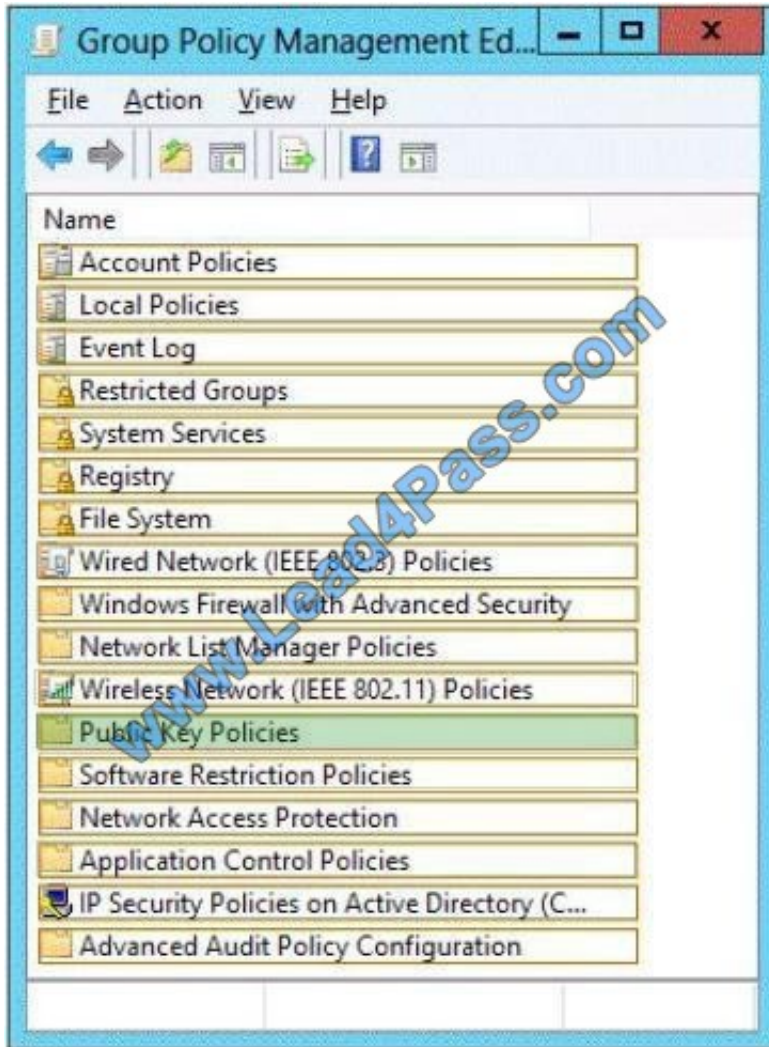

What should you use in Group Policy Management Editor?

To answer, select the appropriate Group Policy setting in the answer area.

Hot Area:

Correct Answer:

QUESTION 5

Your network contains an Active Directory domain named contoso.com. The domain contains a server that runs Windows Server 2012.

You have an offline image of Windows 8.

You download and extract 10 updates from Microsoft Update.

You plan to deploy the updates to the image.

You need to identify which updates can be fully installed while the image is offline.

What should you do?

A. On Server1, run `dism.exe` and specify the `/mountwim` parameter and the `/get-mountedwiminfo` parameter.

B. On Server1, run the `Mount-WindowsImage` cmdlet, and then run the `Get-WindowsImage` cmdlet.

- C. On Server1, run the Mount-WindowsImage cmdlet, and then run the Get-WindowsPackage cmdlet.
- D. On Server1, run dism.exe and specify the /mount parameter and the /get-wiminfo parameter.

Correct Answer: C
