QUESTION 1

Which of the following reasons justifies why you should audit failed events?

- A. To log resource access for reporting and billing
- B. To monitor for malicious attempts to access a resource which has been denied
- C. None of these
- D. To monitor access that would suggest users are performing actions greater than you had planned

Correct Answer: B

<http://technet.microsoft.com/en-us/library/cc778162%28v=ws.10%29.aspx>

Auditing Security Events Best practices

If you decide to audit failure events in the policy change event category, you can see if unauthorized users or attackers are trying to change policy settings, including security policy settings. Although this can be helpful for intrusion detection,

the increase in resources that is required and the possibility of a denial-of-service attack usually outweigh the benefits.

QUESTION 2

Your network contains one Active Directory domain named contoso.com. The domain contains two servers named Server1 and Server2 that run Windows Server 2012 R2. All domain computers have certificates that are issued by a

certification authority (CA) named Contoso CA. A user named User1 performs daily backups of the data on Server1 to a backup vault named Vault1. A user named User2 performs daily backups of the data on Server2 to a vault named

Vault2. You have the administrative credentials for Server2. You need to restore the data from that last backup of Server1 to Server2.

Which two pieces of information do you require to complete the task? Each correct answer presents part of the solution.

- A. the Microsoft Azure subscription credentials
- B. the Vault2 credentials
- C. the User1 credentials
- D. the Vault1 credentials
- E. the Server1 certificate
- F. the Server2 certificate
- G. the Server1 passphrase
- H. the Server2 passphrase

Correct Answer: DG

We need the Vault1 credentials to be able to access the data in Vault1. We need the passphrase of Server1 to access the backup that was made on Server1.

QUESTION 3

Your network contains an Active Directory domain named contoso.com. The domain contains a DHCP server named Server1 that runs Windows Server 2012 R2. You create a DHCP scope named Scope1. The scope has a start address of 192.168.1.10, an end address of 192.168.1.50, and a subnet mask of 255.255.255.192. You need to ensure that Scope1 has a subnet mask of 255.255.255.0.

What should you do first?

- A. From the DHCP console, reconcile Scope1.
- B. From the DHCP console, delete Scope1.
- C. From the DHCP console, modify the Scope Options of Scope1.
- D. From Windows PowerShell, run the Set-DhcpServer4Scope cmdlet.

Correct Answer: B

You cannot modify scope's subnet mask. You need to remove the scope first and then create new scope with correct subnet mask.

QUESTION 4

Your network contains an Active Directory domain named contoso.com. All domain controllers run Windows Server 2012 R2.

In a remote site, a support technician installs a server named DC10 that runs Windows Server 2012 R2. DC10 is currently a member of a workgroup.

You plan to promote DC10 to a read-only domain controller (RODC).

You need to ensure that a user named Contoso\User1 can promote DC10 to a RODC in the contoso.com domain.

The solution must minimize the number of permissions assigned to User1.

What should you do?

- A. From Active Directory Administrative Center, pre-create an RODC computer account.
- B. From Ntdsutil, run the local roles command.
- C. From Dismgmt, run the local roles command.
- D. Join DC10 to the domain. Run dsmod and specify the /server switch.

Correct Answer: A

A staged read only domain controller (RODC) installation works in two discrete phases:

1. Staging an unoccupied computer account
2. Attaching an RODC to that account during promotion

QUESTION 5

Your network contains an Active Directory domain named contoso.com. The network contains a server named Server1 that runs Windows Server 2012 R2 and a server named Server2 that runs Windows Server 2008 R2 Service Pack 1 (SP1). Server1 and Server2 are member servers. You need to ensure that you can manage Server2 from Server1 by using Server Manager. Which two tasks should you perform? (Each correct answer presents part of the solution. Choose two.)

- A. Install Windows Management Framework 3.0 on Server2.
- B. Install Remote Server Administration Tools on Server1.
- C. Install the Windows PowerShell 2.0 engine on Server1.
- D. Install Microsoft .NET Framework 4 on Server2.
- E. Install Remote Server Administration Tools on Server2.

Correct Answer: AD

Software and configuration requirements

Server Manager is installed by default with all editions of Windows Server 2012. Although you can use Server Manager to manage Server Core installation options, Server Manager does not run directly on Server Core installation options.

To fully manage remote servers that are running Windows Server 2008 or Windows Server 2008 R2, install the following updates, in the order shown.

1. .NET Framework 4
2. Windows Management Framework 3.0 The Windows Management Framework 3.0 download package updates Windows Management Instrumentation. Server Manager collect information about roles and features that are installed on the managed servers. Until the update is applied, servers that are **Verify earlier versions run Windows Management Framework 3.0.**
3. The performance update associated with Knowledge Base article 2682011 allows Server Manager to collect performance data from Windows Server
