QUESTION 1

You are developing a SQL Server 2008 Integration Services (SSIS) sample which includes some data flows for Company.com.

Not only you should control the data that passes by every path in the data flow through utilizing the Business Intelligence Development Studio., but also you should make sure that data flow logic is left.

Which is the correct answer?

- A. You should utilize the Data Viewer tool.
- B. You should utilize the Process Control tool.
- C. You should utilize the Audit Control tool.
- D. You should utilize Web Service.

Correct Answer: A

QUESTION 2

You maintain a report in a SQL Server 2008 Reporting Services (SSRS) instance.

The report contains query parameters that allow users to filter the contents of the report. The report queries the data source randomly.

You configure the report to be rendered from a report execution snapshot. You need to ensure that users can continue to use parameters to filter the report.

What should you do?

- A. Add a default value to all parameters.
- B. Modify the datasets to use the Table query type.
- C. Remove the filters from the dataset queries. Use the parameters to filter the datasets.
- D. Move the queries to the stored procedures. Use the stored procedures to populate and filter the datasets of the report.

Correct Answer: C

QUESTION 3

You are a database developer and you have about two years experience in creating business intelligence (BI) solutions by using SQL Server2008.

Now you are employed in a company which is named NaproStar and work as a developer of a SQL Server 2008 Reporting Services (SSRS) for the company. To meet the business requirements, you use SSRS to develop a production report

with a table contained.

Now you get an order from your company CIO, according to his requirement, when users click on a field in the table, a SSRS technology should be executed to open a new report for them.

Which SSRS technology should be used to achieve this goal?

- A. Tablix Data Region should be used to achieve this goal
- B. Drillthrough action should be used to achieve this goal
- C. Interactive Sorting should be used to achieve this goal
- D. Interactivereport Data should be used to achieve this goal
- E. Subreport should be used to achieve this goal

Correct Answer: B

QUESTION 4

You develop a report by using SQL Server 2008 Reporting Services (SSRS).

The report has a dataset that contains 25 columns of data. You plan to render the dataset to a Microsoft Office Excel worksheet.

You need to ensure that the report columns are properly aligned when rendering to Excel.

Which type of data region should you use?

- A. List
- B. Table
- C. Rectangle
- D. Matrix

Correct Answer: B

Tables in reports are rendered as rows and columns of cells in Excel. Page breaks on report items inside a table cell are ignored.

Note: A data region is an area on a report containing data from a data source. Types of data regions are charts, lists, tables, and matrices.

Incorrect answers:

List elements show only their contents. The list is rendered for each data row or data group in Excel. Items in the list are positioned on the worksheet relative to their location in the report, which can lead to unexpected results. For this reason,

lists are not recommended for incorporation in reports designed to be rendered in Excel.

Matrices in reports are rendered as a set of formatted cells in the Excel file, much like the report in HTML. Matrix

subtotals are not rendered as formulas, and the matrix is not rendered as an Excel PivotTable. Matrix data regions are fully

expanded when rendered in Excel. If you hide all or part of a matrix at design time, at run time the hidden property is ignored and all rows and columns are visible in the report.

QUESTION 5

You develop a package by using SQL Server 2008 Integration Services (SSIS).

You use a local instance of SSIS to develop and test the package.

The package uses an XML configuration file that contains a connection string. The connection string includes a user name and a password to connect to the source data. You deploy the package to the production server. You discover that

validation errors occur when the package is being executed.

You need to ensure that the package executes successfully in the production environment.

What should you do?

- A. Configure the package to use the DontSaveSensitive package protection level.
- B. Configure the package to use the EncryptSensitiveWithPassword package protection level.
- C. Configure the package to use the EncryptAllWithUserKey package protection level.
- D. Remove the user name and the password from the connection string before you deploy the package.

Correct Answer: B
