-  **365 Days** Free Update
-  **800,000+** Satisfied Customers

QUESTION 1

You are a database developer. You plan to design a database solution by using SQL Server 2008.

A frequently used query takes very long to execute.

You discover that the query frequently uses full-table scans instead of indexes. This causes other queries that modify the table to be blocked.

The indexing strategy on the underlying tables that the query uses can change.

You need to design a solution that performs the following tasks:

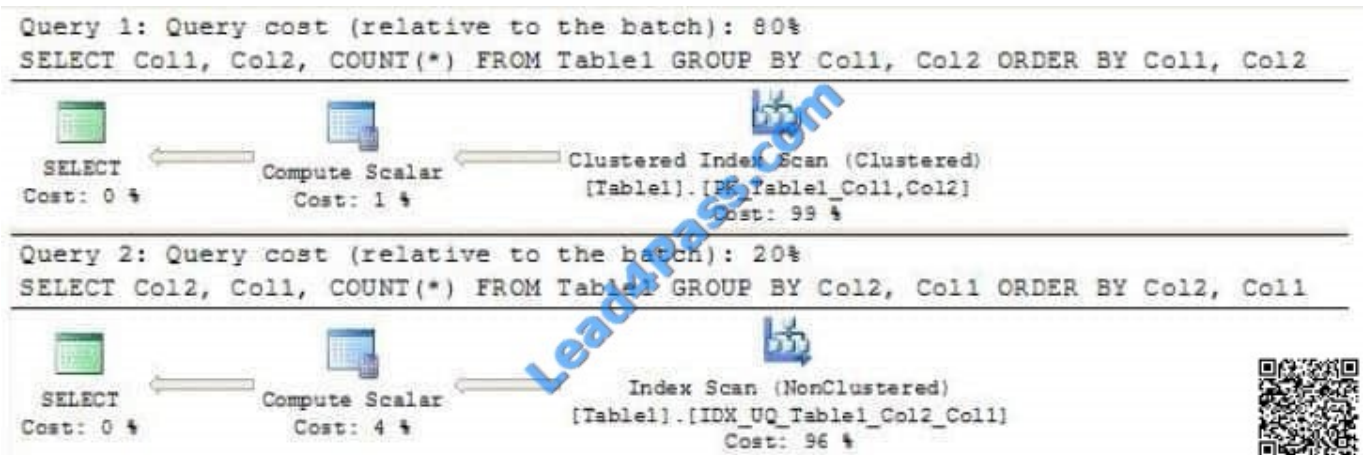

What should you do?

- A. Use the INDEX table hint.
- B. Use the INDEX(0) table hint.
- C. Use the NOEXPAND table hint.
- D. Use the FORCESEEK table hint.

Correct Answer: D

QUESTION 2

You have an execution plan as shown in the exhibit. (Click the Exhibit button.)

The indexes and keys for the table are as follows:

You need to recommend changes to the table to minimize the response time for both queries.

What should you do?

- A. Include all the columns of the table in the existing nonclustered index.
- B. change the order of the columns in the existing nonclustered index.
- C. Add a unique nonclustered index to Col1 and Col2.
- D. Remove the nonclustered index.

Correct Answer: C

QUESTION 3

You are a database developer. You develop solutions by using SQL Server 2008 in an enterprise environment.

You are creating a SQL Agent job that uses Transact-SQL to update data in two related databases on two different servers.

You have the following requirements:

What should you do?

- A. Ensure both databases are altered using the NO_WAIT termination clause.
- B. Use the Windows Sync Manager to ensure that the databases can never be out of synchronization.
- C. Use saved transactions. When a database failure occurs, restore both databases by using a saved transaction.
- D. Use marked transactions. When a database failure occurs, restore both databases by using a marked transaction.

Correct Answer: D

QUESTION 4

You review the execution plan for a query that contains a join. The execution plan contains a RID Lookup.

You need to reduce the I/O that is generated by the RID Lookup.

Which index should you create?

- A. unique nonclustered
- B. clustered
- C. nonunique covering
- D. Full-Text-Search

Correct Answer: B

QUESTION 5

You have a table that contains 10 million rows.

You need to design a query that returns a 100,000-row sample dataset. The solution must minimize the query's execution time.

The sample may contain inconsistent data.

Which isolation level should you set to ON?

- A. READ COMMITTED SNAPSHOT
- B. READ COMMITTED
- C. REPEATABLE READ
- D. READ UNCOMMITTED

Correct Answer: D
