QUESTION 1

You need to configure security on the Product table for customer support representatives.

Which two actions should you perform? Each correct answer presents part of the solution. Choose two.

- A. Create a view called CustProduct that includes columns ProductID, ProductName, Product Description, QuantityOnHand, ProductPrice, ProductCost, and ProductSupplierID.
- B. GRANT ALL on CustProduct TO OurDomain\CustomerSupport.
- C. Create a user-defined data type called CustProduct that includes columns ProductID, ProductName, Product Description, and ProductPrice.
- D. Create a view called CustProduct that includes columns ProductID, ProductName, Product Description, QuantityOnHand, and ProductPrice.
- E. GRANT SELECT on CustProduct TO OurDomain\CustomerSupport.
- F. GRANT SELECT on CustProduct TO public.

Correct Answer: AE

Give access to CustomerSupport through a view. The view must include all these columns (refer to scenario).

QUESTION 2

You need to recommend the actions that are required to partition a table.

In which order should the four actions be performed? To answer, move the actions from the list of actions to the answer area and arrange them in the correct order.

Select and Place:

Actions	Answer Area
Create a partition scheme.	
Create a partition function.	
Create filegroups.	
Create the table.	

Correct Answer:

Actions	Answer Area
	Create filegroups.
	Create a partition function.
	Create a partition scheme.
	Create the table.

create a partitioned table using the AdventureWorks2012 database:

```
CREATE PARTITION FUNCTION TransactionRangePF1 (DATETIME)
AS RANGE RIGHT FOR VALUES
(
  \20071001\, \20071101\, \20071201\, \20080101\,
  \20080201\, \20080301\, \20080401\, \20080501\,
  \20080601\, \20080701\, \20080801\
);
GO
CREATE PARTITION SCHEME TransactionsPS1 AS PARTITION TransactionRangePF1 TO (
  [PRIMARY], [PRIMARY], [PRIMARY], [PRIMARY], [PRIMARY],
  [PRIMARY], [PRIMARY], [PRIMARY], [PRIMARY], [PRIMARY],
  [PRIMARY], [PRIMARY], [PRIMARY]
);
GO
CREATE TABLE dbo.TransactionHistory
(
  TransactionID INT NOT NULL, -- not bothering with IDENTITY here
  ProductID INT NOT NULL,
  ReferenceOrderID INT NOT NULL,
  ReferenceOrderLineID INT NOT NULL DEFAULT (0),
```

```
TransactionDate DATETIME NOT NULL DEFAULT (GETDATE()),  
TransactionType NCHAR(1) NOT NULL,  
Quantity INT NOT NULL,  
ActualCost MONEY NOT NULL,  
ModifiedDate DATETIME NOT NULL DEFAULT (GETDATE()),  
CONSTRAINT CK_TransactionType  
CHECK (UPPER(TransactionType) IN (N'W', N'S', N'P'))  
)  
ON TransactionsPS1 (TransactionDate);  
GO
```

QUESTION 3

You need to recommend an isolation level for usp_UpdateOrderDetails. Which isolation level should recommend?

- A. Read committed
- B. Repeatable read
- C. Read uncommitted
- D. Serializable

Correct Answer: B

*

Scenario: Databasel will also contain a stored procedure named usp_UpdateOrderDetails. The stored procedure is used to update order information. The stored procedure queries the Orders table twice each time the procedure executes. The rows returned from the first query must be returned on the second query unchanged along with any rows added to the table between the two read operations.

*

REPEATABLE READ Specifies that statements cannot read data that has been modified but not yet committed by other transactions and that no other transactions can modify data that has been read by the current transaction until the current transaction completes.

QUESTION 4

Your network contains an Active Directory domain that has two groups named Group1 and Group2.

The domain contains two SQL Server instances named SQLDev and SQLProd. Each SQL Server instance has access to various storage media.

The SQL Server instances have a database that contains a table named Table1.

Table1 contains a column named Column1. The value for Column1 can be either Value1 or Value2.

You need to recommend a solution to ensure that users in Group1 can retrieve only rows from Column1 that contain the value of Value1.

What should you recommend?

- A. A dynamic management view
- B. Filegroups
- C. Snapshot isolation
- D. User-defined views

Correct Answer: D

A view is a virtual table whose contents are defined by a query. Like a table, a view consists of a set of named columns and rows of data. Unless indexed, a view does not exist as a stored set of data values in a database. The rows and columns of data come from tables referenced in the query defining the view and are produced dynamically when the view is referenced.

A view acts as a filter on the underlying tables referenced in the view.

<http://msdn.microsoft.com/en-us/library/ms190174.aspx> Incorrect:

Not A: Dynamic management views and functions return server state information that can be used to monitor the health of a server instance, diagnose problems, and tune performance.

[http://technet.microsoft.com/en-us/library/ms188754\(v=sql.120\).aspx](http://technet.microsoft.com/en-us/library/ms188754(v=sql.120).aspx)

QUESTION 5

You need to recommend a solution to improve the performance of usp.UpdateInventory. The solution must minimize the amount of development effort.

What should you include in the recommendation?

- A. A table variable
- B. A common table expression
- C. A subquery
- D. A cursor

Correct Answer: A

*Scenario: Database2 will contain a stored procedure named usp_UpdateInventory. Usp_UpdateInventory will manipulate a table that contains a self-join that has an unlimited number of hierarchies.

*

A table variable can be very useful to store temporary data and return the data in the table format.

*

Example: The following example uses a self-join to find the products that are supplied by more than one vendor.

Because this query involves a join of the ProductVendor table with itself, the ProductVendor table appears in two roles. To distinguish these roles, you must give the ProductVendor table two different aliases (pv1 and pv2) in the FROM clause. These aliases are used to qualify the column names in the rest of the query.

This is an example of the self-join Transact-SQL statement: USE AdventureWorks2008R2; GO SELECT DISTINCT pv1.ProductID, pv1.VendorID FROM Purchasing.ProductVendor pv1 INNER JOIN Purchasing.ProductVendor pv2 ON pv1.ProductID = pv2.ProductID AND pv1.VendorID < pv2.VendorID ORDER BY pv1.ProductID

Incorrect:

Not B: Using a CTE offers the advantages of improved readability and ease in maintenance of complex queries. The query can be divided into separate, simple, logical building blocks. These simple blocks can then be used to build more complex, interim CTEs until the final result set is generated.
