QUESTION 1

An existing cube dimension that has 30 attribute hierarchies is performing very poorly. You have the following requirements:

Implement drill-down browsing.

Reduce the number of attribute hierarchies but ensure that the information contained within them is available to users on demand.

Optimize performance.

You need to redesign the cube dimension to meet the requirements.

What should you do? (More than one answer choice may achieve the goal. Select the BEST answer.)

A. set the AggregateFunction property to Sum on all measures. Use the SCOPE statement in a Multidimensional Expressions (MDX) calculation to tune the aggregation types.

B. Set the AttributeHierarchyOptimizedState property to FullyOptimized on the attribute hierarchies.

C. Create user-defined hierarchies. For the attributes sourced by the levels of the user-defined hierarchies, set the RelationshipType property to Rigid. Run incremental processing.

D. Remove as many attribute hierarchies as possible from the dimension. Reintroduce the information in the attribute hierarchies as properties. Implement natural hierarchies and set the AttributeHierarchyVisible property to False for attributes used as levels in the natural hierarchies.

Correct Answer: D

QUESTION 2

You are developing the database schema for a SQL Server Analysis Services (SSAS) BI Semantic Model (BISM). The BISM will be based on the schema displayed in the following graphic.

You have the following requirements:

Ensure that queries of the data model correctly display average student age by class.

Ensure that the solution supports role-based security and partitions.

Minimize development effort.

You need to design the data model.

What should you do? (More than one answer choice may achieve the goal. Select the BEST answer.)

- A. Create a multidimensional project and define measures and a many-to-many dimensional relationship. Create partitions in SQL Server Management Studio (SSMS).
- B. Create a multidimensional project and define measures and a reference relationship. Create partitions in SQL Server Data Tools (SSDT).
- C. Create a tabular project and define measures. Create partitions in SQL Server Data Tools (SSDT).
- D. Create a tabular project and define calculated columns. Create partitions in SQL Server Management Studio (SSMS).

Correct Answer: A

QUESTION 3

You are developing a SQL Server Analysis Services (SSAS) tabular database.

To maximize performance, the queries must be resolved by using cache unless otherwise specified in the connection string.

You need to configure the appropriate query mode.

Which query mode should you select?

- A. In-Memory with DirectQuery
- B. DirectQuery with In-Memory
- C. DirectQuery
- D. In-Memory

Correct Answer: A

QUESTION 4

You administer a SQL Server Reporting Services (SSRS) infrastructure. Data alerts are provisioned.

You need to monitor the number of report data feed processing events during every automated execution.

Which three actions should you perform in sequence? (To answer, move the appropriate actions from the list of actions to the answer area and arrange them in the correct order.)

Select and Place:

Query the **Alerting: events processed - FireAlert** events.

Capture the **Alerting: events processed - DeliverAlert** values and compare them to the previously queried events.

Query the **Alerting: events processed - GenerateAlert** event.

Capture the **Alerting: events processed - FireSchedule** values and compare them to the previously queried events.

Use a WMI client.

Open Data Alert Manager.

Correct Answer:

Query the **Alerting: events processed - FireAlert** events.

Capture the **Alerting: events processed - FireSchedule** values and compare them to the previously queried events.

Use a WMI client.

Capture the **Alerting: events processed - DeliverAlert** values and compare them to the previously queried events.

Open Data Alert Manager.

Query the **Alerting: events processed - GenerateAlert** event.

QUESTION 5

A SQL Server Analysis Services (SSAS) cube has roles to define dimension data security.

A role named USA allows users to browse data pertaining to the United States. A role named Canada allows users to browse data pertaining to Canada.

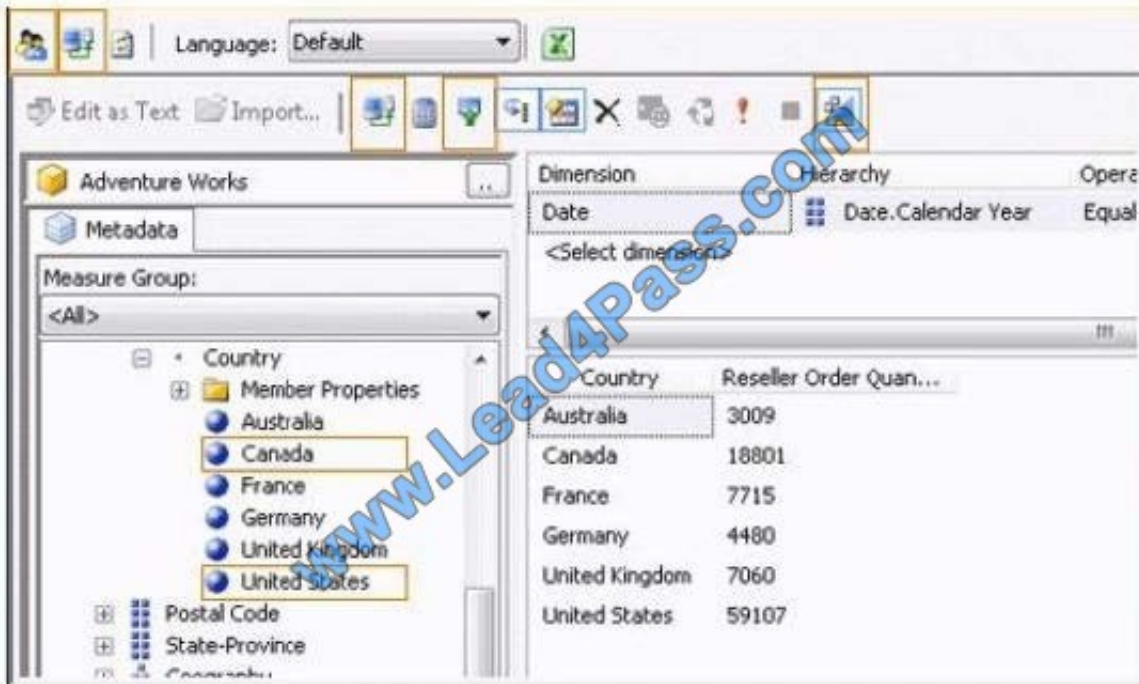

A user can browse sales data pertaining to the United States but cannot browse sales data pertaining to Canada. You validate that the user belongs to the USA and Canada roles.

You need to reproduce the issue in SQL Server Management Studio (SSMS).

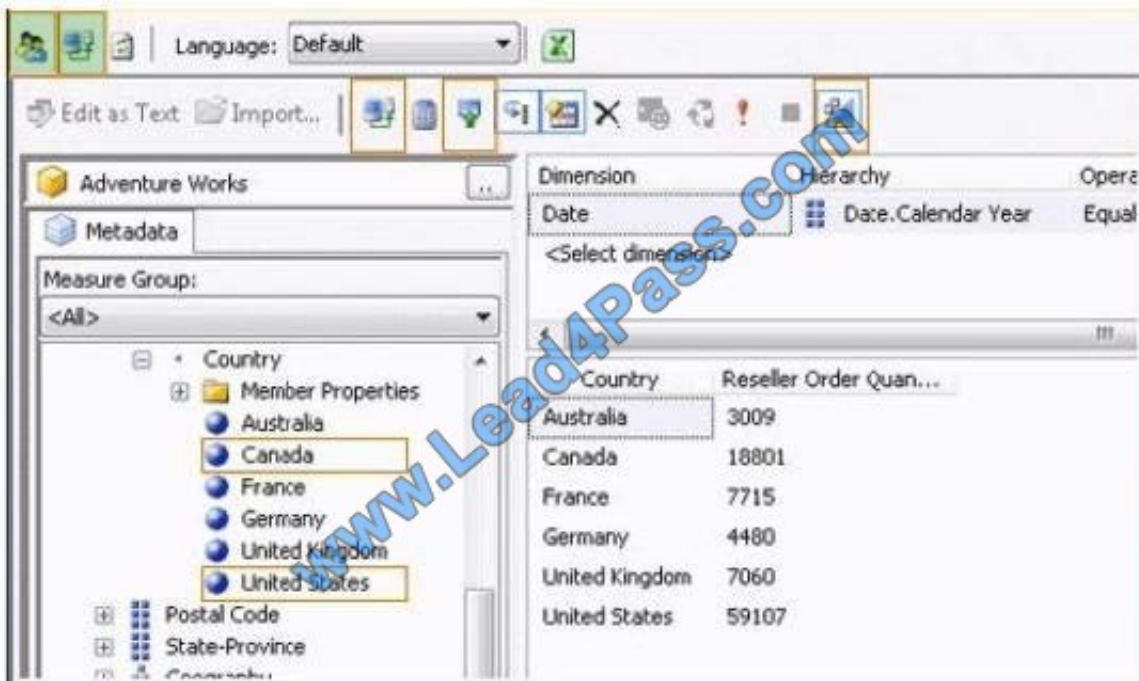

Which option should you select? To answer, select the appropriate action in the answer area.
