QUESTION 1

You need to create a custom sign-in page to allow the users of the FranchiseMonitor app to authenticate against SharePoint and Margie\\'s Travel API.

What should you do?

A. Create an app for SharePoint. Set the trust level to Sandbox solution. Create an application page that writes a cookie named FedAuth. Deploy the app and configure the Sign In Page URL in Central Administration Authentication Provider for the zone.

B. Create an app for SharePoint. Set the trust level to Farm solution. Create an application page that writes a cookie named FedAuth. Deploy the app and configure the Sign In Page URL in Central Administration Authentication Provider for the zone.

C. Create an app for SharePoint. Set the trust level to Farm solution. Create an application page that writes a cookie named ASPXAUTH. Deploy the app and configure the Sign In Page URL in Central Administration Authentication Provider for the zone.

D. Create an app for SharePoint. Set the trust level to Sandbox solution. Create an application page that writes a cookie named ASPXAUTH. Deploy the app and configure the Sign In Page URL in Central Administration Authentication Provider for the zone.

Correct Answer: B

The new claims-based authentication in SharePoint 2010 does not use the ASPXAUTH cookie, instead it uses the FedAuth cookie. SharePoint 2013 tracks FedAuth cookies in the new distributed cache service using Windows Server AppFabric Caching.

Scenario: The FranchiseMonitor app must use claims-based authentication, once launched, to authenticate the franchisee against an API provided by Margie\\'s Travel.

QUESTION 2

DRAG DROP

You plan to create a search-driven navigation that supports the Cross-site Publishing Feature.

Which four actions should you perform in sequence? (To answer, move the appropriate actions from the list of actions to the answer area and arrange them in the correct order.)

Select and Place:

Actions

Insert a Search Box Web Part on the page.

Insert a Content Search Web Part on the page.

Insert a Search Result Web Part on the page.

Select the **Change query** button.

Build and save the query.

Select the **Edit Web Part** link.

Answer Area

Correct Answer:

Actions

Insert a Search Box Web Part on the page.

Select the **Change query** button.

Answer Area

Insert a Content Search Web Part on the page.

Select the **Edit Web Part** link.

Build and save the query.

Insert a Search Result Web Part on the page.

Note:

Box 1: Add a Content Search Web Part to a page

Box 2-3: Configure the query for a Content Search Web Part

In the Web Part, click the Content Search Web Part Menu arrow, and then click Edit Web Part.

In the Web Part tool pane, in the Properties section, in the Search Criteria section, click Change query.

Edit and change the query.

Box 4: (Search Result Web Part)

Here are some tools that make Cross-Site Publishing happen.

/ Content Search Web Part:

It allows to build your own query using a wizard, this means fetching the content you want to see, and then allows you to display them using predefined display templates. It uses Search to query, which therefore allows us to show content

from another Site.

/ Search Results Web Part:

It can either show the results of a typed query in the Search Box, which is the traditional Search Results we know. But, and this is key, the Search Results also allows you to build a Query using the same Query Builder in the Content Search.

In fact, I have found the Search Results to offer 95% of the same functionality as the Content Search. Therefore, it can also be used in Cross-Site Publishing Scenarios.

Reference: Configure Search Web Parts in SharePoint Server 2013

QUESTION 3

HOTSPOT

You need to add code at line UA09 to create the custom role.

How should you complete the relevant code? (To answer, select the appropriate code segment from each drop-down list in the answer area.)

Hot Area:

```
var customRole =                              ▼  ();

                SPRoleDefinition
                SPRoleAssignment
                SPRoleDefinitionCollection

customRole.Name = "Wholesale";
customRole.Description = "Custom role for Wholesale customers";

                                          ▼

web.RoleAssignment.Add(customRole);
web.RoleDefinitions.Add(customRole);
web.RoleDefinitionCollection.Add(customRole);

                                          ▼

web.Commit()
web.Update()
web.AddProperty(customRole, _permissions)
```

Correct Answer:

* SPRoleDefinition The role definition, or permission level, is the list of rights associated with the role. For example, a user with the Read role can browse pages in the Web site and view items in lists. A role definition is a collection of rights bound to a specific object. Role definitions (for example, Full Control, Read, Contribute, Design, or Limited Access) are scoped to the Web site.

* SPWeb.Update

Scenario: User Authorization

A custom role named Wholesale must be created. Wholesale customers must be assigned to this role in order to view the promotions page.

Incorrect:

Not RoleDefinitionCollection: SPWeb does not have a member RoleDefinitionCollection.

Not web.Commit(): SPWeb does not have a method Commit().

Not web.AddProperty(CustomRole,_permissions)

Just need to create the role, not add permissions.

Reference: SPWeb members; SPWeb methods

QUESTION 4

A user deploys a sandbox solution.

The user cannot activate the solution.

You need to ensure that the user can activate the solution.

What should you do? (Each correct answer presents a complete solution. Choose all that apply.)

A. Grant permission to the user to activate the solution.

B. Grant permission to the user to execute the solution.

C. Configure a local mode load-balancing scheme.

D. Stop the Microsoft User Code Host Service.

E. Configure a remote mode load-balancing scheme.

F. Start the Microsoft SharePoint Foundation Sandboxed Code Service.

Correct Answer: AF

A: Need to activate the feature that provisions the files. siteCollection.Features.Add([guid_of_your)feature])

F: To enable sandboxed solutions by using Central Administration

1.

Verify that you have the following administrative credentials:

2.

On the home page of the Central Administration Web site, in the System Settings section, click Manage services on server.

3.

On the Services on Server page, in the Server box, select the server on which you want to enable sandboxed solutions.

4.

In the Microsoft SharePoint Foundation Sandboxed Code Service row, in the Action column, click Start.

QUESTION 5

DRAG DROP

You develop a SharePoint app to access data contained in a hosted SharePoint site.

You need to authorize the app to access the list items in a custom list on the host website.

You have the following code:

```
Target 1.TrustAllCertificates();
string Target 2 =
Target 3.GetContextTokenFromRequest(Request);
if (contextTokenStr != null)
{
  contextToken = Target 4.ReadAndValidateContextToken
   (Target 5 , Request.Url.Authority);
  sharepointUrl = new Uri(Request.QueryString["SPHostUrl"]);
  accessToken = TokenHelper.Target 6
   (contextToken,sharepointUrl.Authority).AccessToken;
  Button1.CommandArgument = accessToken;
}
```

Which code segments should you include in Target 1, Target 2, Target 3, Target 4, Target 5 and Target 6 to complete the code? (To answer, drag the appropriate code segments to the correct location or locations in the answer area. Each code segment may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content)

Select and Place:

Code Segments	Answer Area	
ListHelper	Target 1:	Code Segment
SecureAgent	Target 2:	Code Segment
TokenHelper	Target 3:	Code Segment
GetAccessToken	Target 4:	Code Segment
contextTokenStr	Target 5:	Code Segment
	Target 6:	Code Segment

Correct Answer:

Code Segments	Answer Area	
ListHelper	Target 1:	TokenHelper
SecureAgent	Target 2:	contextTokenStr
TokenHelper	Target 3:	TokenHelper
GetAccessToken	Target 4:	TokenHelper
contextTokenStr	Target 5:	contextTokenStr
	Target 6:	GetAccessToken

* (Target1) TokenHelper.TrustAllCertificates

If you are using Visual Studio 2012, it adds 'TrustAllCertificates' in TokenHelper.cs by default.

* (target3) Tokenhelper.GetContextTokenFromRequest

* (Target2, Target4, target5)Tokenhelper.ReadAndValidateContextToken

Example:

string contextTokenString = TokenHelper.GetContextTokenFromRequest(Page.Request);

SharePointContextToken contextToken = TokenHelper.ReadAndValidateContextToken(contextTokenString, Request.Url.Authority);

*(Target6) TokenHelper.GetAccessToken

Example:

//Get user+app access token.

string accessToken =

TokenHelper.GetAccessToken(contextToken, sharepointUrl.Authority).AccessToken;
