100% Passing Guarantee
100% Money Back Assurance

Following Questions and Answers are all new published by Microsoft Official Exam Center

-  **Instant Download** After Purchase
-  **100% Money Back** Guarantee
-  **365 Days** Free Update
-  **800,000+** Satisfied Customers

QUESTION 1

A Windows Communication Foundation (WCF) service interacts with the database of a workflow engine. Data access authorization is managed by the database, which raises security exceptions if a user is unauthorized to access it.

You need to ensure that the application transmits the exceptions raised by the database to the client that is calling the service. Which behavior should you configure and apply to the service?

- A. routing
- B. serviceDebug
- C. serviceSecurityAudit
- D. workflowUnhandledException

Correct Answer: B

QUESTION 2

You have a Windows Communication Foundation (WCF) service that uses a multicast protocol as a custom transport. The service implements the channel framework.

You need to choose a message exchange pattern for the transport.

What should you use?

- A. Datagram by using the `IOutputChannel` interface for clients and the `IInputChannel` interface for the service.
- B. Half-Duplex by using the `IRequestChannel` interface for clients and the `IReplyChannel` interface for the service.
- C. Duplex by using the `IDuplexChannel` interface for both clients and the service.
- D. Request-Response by using the `IRequestChannel` interface for clients and the `IReplyChannel` interface for the service.

Correct Answer: A

QUESTION 3

You are creating a Windows Communication Foundation (WCF) service application. The application needs to service many clients and requests simultaneously.

The application also needs to ensure subsequent individual client requests provide a stateful conversation.

You need to configure the service to support these requirements.

Which attribute should you add to the class that is implementing the service?

- A. [`ServiceBehavior (InstanceContextMode = InstanceContextMode.PerSession, ConcurrencyMode = ConcurrencyMode.Single)`]

B. [ServiceBehavior (InstanceContextMode = InstanceContextMode.PerCall, ConcurrencyMode = ConcurrencyMode.Reentrant)]

C. [ServiceBehavior (InstanceContextMode = InstanceContextMode.PerSession, ConcurrencyMode = ConcurrencyMode.Multiple)]

D. [ServiceBehavior (InstanceContextMode = InstanceContextMode.PerCall, ConcurrencyMode = ConcurrencyMode.Multiple)]

Correct Answer: C

QUESTION 4

You are developing a Windows Communication Foundation (WCF) service. You enable message logging, trace listeners, activity propagation, and tracing on the trace sources.

You have the following code segment in the client application. (Line numbers are included for reference only.)

```
01 Guid multiCallActivityId = Guid.NewGuid();
02 TraceSource ts = new TraceSource("Multicall");
03 Trace.CorrelationManager.ActivityId =
    multiCallActivityId;
04
```

You encounter errors when your client application consumes the service. You need to ensure that your client application can correlate tracing information with the service. Which code segment should you add at line 04?

- A. `ts.TraceEvent(TraceEventType.Start, 0, "Calling first service");`
`ts.TraceTransfer(100, "Transferring...", Guid.NewGuid());`
...
`ts.TraceEvent(TraceEventType.Stop, 0, "Return from first service.");`
- B. `ts.TraceEvent(TraceEventType.Start, 0, "Calling first service");`
`Trace.CorrelationManager.StartLogicalOperation("1");`
...
`ts.TraceEvent(TraceEventType.Stop, 0, "Return from first service.");`
- C. `ts.TraceEvent(TraceEventType.Start, 0, "Calling first service");`
`ts.TraceTransfer(100, "Transferring...", multiCallActivityId);`
...
`ts.TraceEvent(TraceEventType.Stop, 0, "Return from first service.");`
- D. `Trace.CorrelationManager.StartLogicalOperation("1");`
...
`Trace.CorrelationManager.StopLogicalOperation();`
- 

A. B. C. D.

Correct Answer: C

QUESTION 5

You are developing a Windows Communication Foundation (WCF) service. One of the parameters used with the service operations is a security token. The security token is not sensitive. The monitoring software tracks security tokens and can read tokens in clear text only.

The company security policy requires that you validate all clear text data passed over the corporate network.

You need to ensure that the service verifies that the security token is not changed during transit.

What should you do?

- A. Implement `IEndpointIdentityProvider` in the message contract class.
- B. For all the security-sensitive members, set the `ProtectionLevel` parameter of the `MessageBodyMember` or `MessageHeader` attribute to `EncryptAndSign`.
- C. For all the security-sensitive members, set the `ProtectionLevel` parameter of the `MessageBodyMember` or `MessageHeader` attribute to `Sign`.
- D. Implement `ISecureConversationSession` in the message contract class.

Correct Answer: C
