QUESTION 1

You plan to create a Linux virtual machine on an Azure Stack integrated system.

You download an Ubuntu Server image.

Which authentication method can use to access the Linux virtual machine by using SSH?

- A. The Extensible Authentication Protocol (EAP)
- B. a Kerberos token
- C. a service principal
- D. a key pair

Correct Answer: D

QUESTION 2

HOTSPOT

You are preparing a Linux image for upload to Azure Stack.

You need to install the Microsoft Azure Linux Agent manually.

You install the python-setuptools.

Which command should you run next? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

sudo

apt-get
python3
yum

 setup.py

install
python-setuptools
update

 --register-service

Correct Answer:

Answer Area

```
sudo 

|         |
|---------|
| apt-get |
| python3 |
| yum     |

 setup.py 

|                   |
|-------------------|
| install           |
| python-setuptools |
| update            |

 --register-service
```

QUESTION 3

Note: This question is part of a series of questions that use the same scenario. For your convenience, the scenario is repeated in each question. Each question presents a different goal and answer choices, but the text of the scenario is exactly the same in each question in this series.

Start of repeated scenario.

Your company has a main office in New York and a branch office in Toronto. Each office has a dedicated connection to the Internet. Each office has a firewall that uses inbound and outbound rules.

The company has an on-premises network that contains several datacenters. The datacenters contain multiple hypervisor deployments, including Windows Server 2016 Hyper-V. The network uses Microsoft System Center for monitoring and

Windows Azure Pack for self-service.

The company has a Microsoft Azure subscription that contains several workloads. You use Azure Resource Manager templates and other automated processes to create and manage the resources in Azure.

You have an Azure Stack integrated system in the New York office. The company has a development team in the Toronto office and a development team in the New York office. The system has an offer named Offer1. Several tenants have

subscriptions based on Offer1.

You have a Hyper-V host named Server1 that runs Windows Server 2012 R2. Server1 is used for testing. The hardware on Server1 can support the deployment of the Azure Stack Development Kit.

You have a Generation 1 virtual machine named VM1 that runs Windows Server 2012 R2. VM1 is deployed to a Hyper-V host that runs Windows Server 2016. VM1 has a fixed size disk named VM1.vhdx that is 200 GB.

End of repeated scenario.

The development team in the Toronto office fails to access the Azure Stack integrated system. The team successfully accesses the Azure subscriptions. The development team in the New York office successfully accesses the Azure Stack

integrated system.

You need to ensure that the Toronto development team can access the system.

What should you do?

- A. For the Toronto development team, allow the inbound endpoints of the Azure Stack infrastructure on the New York office firewalls.
- B. Create a site-to-site VPN connection from Azure to the New York office.
- C. For the Toronto development team, allow ports 4443 and 8080 on the New York firewalls.
- D. Configure and enable iDNS.

Correct Answer: B

QUESTION 4

HOTSPOT

Note: This question is part of a series of questions that use the same scenario. For your convenience, the scenario is repeated in each question. Each question presents a different goal and answer choices, but the text of the

scenario is exactly the same in each question in this series.

Start of repeated scenario.

Your company has a network that contains an Active Directory forest named fabrikam.com. The forest is synchronized to a Microsoft Azure Active Directory (Azure AD) tenant and has an Azure subscription. The company also has an Azure AD tenant named contoso.com. Contoso.com has an Azure subscription. Contoso.com includes foreign principals.

Computer name	Operating system	Configuration
Server1	Windows Server 2016 Datacenter	Hyper-V host that hosts two test virtual machines
Server2	Windows Server 2016 Datacenter	Microsoft SQL Server 2016 server primary replica of an Always On availability group in a cluster named Cluster1
Server3	Windows Server 2016 Datacenter	Microsoft SQL Server 2016 server, secondary replica of an Always On availability group in Cluster1
Server4	Windows Server 2016 Datacenter	Member of Cluster1
Server5	Windows Server 2016 Datacenter	File server
Client1	Windows 10 Enterprise	Privileged access workstation

The network contains the computers configured as shown in the following table.

Fabrikam.com contains a user named User1.

For operating system deployment, the company uses a custom operating system image of Windows Server 2016 Datacenter named Image1.

You have an Azure Stack integrated system that is accessed by using the following endpoints:

1.

<https://portal.fabrikam.com>

2.

<https://adminportal.fabrikam.com>

3.

<https://management.fabrikam.com>

4.

Privileged endpoint: 192.168.100.100

5.

Hardware lifecycle host: 192.168.101.101

6.

<https://adminmanagement.fabrikam.com>

You onboard contoso.com as a guest directory tenant on the Azure Stack integrated system.

You implement in the following Azure Stack providers:

1.

SQL Server

2.

App Service

End of repeated scenario.

You need to configure the App Service resource provider to offer the Small worker tier to tenants.

What should you do? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

QUESTION 5

NOTE: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution,

while others might not have a correct solution.

After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

You have an Azure Stack integrated system that runs in a connected environment.

You need to recommend an interval for installing Microsoft software update packages to Azure Stack. The solution must ensure that you can receive Microsoft support.

Solution: You recommend that Microsoft software updates be installed every six months.

Does this meet the goal?

- A. Yes
- B. No

Correct Answer: B

For your Azure Stack deployment to remain in support, it must run the most recently released update version or run either of the two preceding update versions.

Microsoft will release update packages for Azure Stack integrated systems on a regular cadence that will typically fall on the fourth Tuesday of every month.

Thus to remain in support you must be running one of the last three update versions and, as an update version is released every month, you need to install updates at least every three months.
