QUESTION 1

HOTSPOT

You have an Azure Stack integrated system.

You need to install the Azure Stack-compatible Azure PowerShell modules on a management workstation.

You set the \$profile variable to the correct API version.

Which commands should you run? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Install-Module -Name

AzureRm.BootStrapper
AzureRmProfile
AzureStack

 -Force

Get-AzureRmProfile
Select-AzureRmProfile
Use-AzureRmProfile

 -Profile profile\$ -Force

Correct Answer:

Answer Area

```
Install-Module -Name 

|                      |
|----------------------|
| AzureRm.BootStrapper |
| AzureRmProfile       |
| AzureStack           |

 -Force
```

```

|                       |
|-----------------------|
| Get-AzureRmProfile    |
| Select-AzureRmProfile |
| Use-AzureRmProfile    |

 -Profile profile$ -Force
```

QUESTION 2

You need to install the Azure Stack Development Kit. Telemetry must be turned off on the host. What should you do?

- A. Boot from the CloudBuilder.vhdx file, modify the registry, and then run the asdk-installer.ps1 script.
- B. Boot from the CloudBuilder.vhdx.file, run the asdk-installer.ps1 script, and then run the azurestackdevelopmentkit.exe command.
- C. Mount the CloudBuilder.vhdx file on a Hyper-V host. Run the Add-AzsRegistration cmdlet. Start CloudBuilder.vhdx.
- D. Mount the CloudBuilder.vhdx file on a Hyper-V host. Run the azurestackdevelopmentkit.exe command. Start CloudBuilder.vhdx.

Correct Answer: A

References: <https://docs.microsoft.com/en-us/azure/azure-stack/azure-stack-telemetry>

QUESTION 3

HOTSPOT

You are preparing a Linux image for upload to Azure Stack.

You need to install the Microsoft Azure Linux Agent manually.

You install the python-setuptools.

Which command should you run next? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

sudo

apt-get
python3
yum

 setup.py

install
python-setuptools
update

 --register-service

Correct Answer:

Answer Area

sudo

apt-get
python3
yum

 setup.py

install
python-setuptools
update

 --register-service

QUESTION 4

You have an Azure Stack integrated system that has 100 tenants.

You create a new offer that is Private.

You need to provide the offer to a tenant.

What should you do?

- A. Delegate rights to the tenant user, and then instruct the tenant user to create a new subscription.
- B. Create a new subscription, and then assign the subscription to the tenant.
- C. Run the New-AzsOffer cmdlet, and then specify the tenant user account.
- D. Run the Set-AzsUserSubscription cmdlet, and then specify the subscription of the tenant user.

Correct Answer: B

When you create an offer, you must include at least one base plan, but you can also create add-on plans that users can add to their subscription. A subscription is how users access your offers.

After you create an offer, users need a subscription to that offer before they can use it.

You can create subscriptions for both public and private offers. If do not want your tenants to create their own subscriptions, make all of your offers private, and then create subscriptions on behalf of your tenants. This approach is common

when integrating Azure Stack with external billing or service catalog systems.

After you create a subscription for a user, that user can log into the user portal and will find that they are subscribed to the offer.

Incorrect Answers:

A: As the Azure Stack operator, you can delegate the creation of offers and users to other users by using the delegation functionality.

C: The New-AzsOffer cmdlet creates an offer composing of the specified base plans and add-on plans.

D: The Set-AzsSubscription cmdlet modifies the current logged-in user\'s tenant subscription.

QUESTION 5

NOTE: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution,

while others might not have a correct solution.

After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

You have an Azure Stack integrated system that contains four nodes named Node1, Node2, Node3 and Node4.

You plan to replace Node2.

You need to drain the active workloads that run on Node2.

Solution: From the hardware lifecycle host, you run the Disable-AzsScaleUnitNode cmdlet.

Does this meet the goal?

A. Yes

B. No

Correct Answer: A

The Drain action evacuates all active workloads by distributing them among the remaining nodes in that particular scale unit. To run the drain action through PowerShell, use the Disable-AzsScaleUnitNode cmdlet.
