QUESTION 1

You use BizTalk Server 2010 to send EDI purchase orders to three trading partners. All of the trading partners use the same version of the purchase order message but define custom codes for the product types. The trading partners confirm purchase order acknowledgements by email instead of through response messages. The standard purchase order schemas included with BizTalk do not include the custom product type codes for each trading partner. You need to ensure that each trading partners purchase order schema is the schema that is used for orders that are sent to them.

What should you do?

- A. Under the transaction set settings for the party, define an envelope for each trading partner. For the namespace, use the custom namespace you defined for each BizTalk schema.
- B. Under the transaction set settings for the party, define a local host setting for each trading partner. For the namespace, use the custom namespace you defined for each BizTalk schema.
- C. Under the transaction set settings for the party, define an envelope for each trading partner. For the namespace, use the default namespace defined by BizTalk for EDI messages.
- D. Under the transaction set settings for the party, define a local host setting for each trading partner. For the namespace, use the default namespace defined by BizTalk for EDI messages.

Correct Answer: A

QUESTION 2

You use BizTalk Server 2010 to receive flat file messages from a customer. You create a pipeline for disassembling the flat file messages. When BizTalk receives the messages, the flat file disassembler throws an error because a date is in the wrong format. The customer cannot change the sending application. You implement a custom pipeline component for correcting date formatting errors. You need to create a new pipeline for processing the messages received from the customer.

What should you do?

- A. Add the custom pipeline component to the Validate stage. Add the EDI disassembler to the Disassemble stage.
- B. Add the custom pipeline component to the Resolve Party stage. Add the EDI disassembler to the Disassemble stage.
- C. Add the custom pipeline component to the Validate stage. Add the flat file disassembler to the Disassemble stage.
- D. Add the custom pipeline component to the Decode stage. Add the flat file disassembler to the Disassemble stage.

Correct Answer: D

QUESTION 3

A BizTalk Server 2010 solution uses Business Activity Monitoring (BAM) to collect business information. The solution contains a BAM view named OrderView. After you deploy the view, application users can log on to the BAM portal but the

OrderView view does not appear to them. You need to ensure that the BAM portal displays the OrderView view to application users.

What should you do?

- A. Use the BizTalk Tracking Profile Utility (bttdeploy.exe) to redeploy the tracking profile used in this solution.
- B. Use the Business Activity Monitoring Utility (bm.exe) to add a subscription for the OrderView view.
- C. Create a Microsoft SQL Server logins for the users on the server that hosts the BAMPrimaryImport database.
- D. Use the Business Activity Monitoring Utility (bm.exe) to grant the users access to the OrderView view.

Correct Answer: D

QUESTION 4

A BizTalk Server 2010 application is deployed and running. The application has a long-running orchestration with only a single Receive shape that activates the orchestration. There are currently instances of this orchestration in the dehydrated state. You need to make sure that no new orchestration instances are started but that existing instances are allowed to complete.

What should you do?

- A. Stop all host instances.
- B. Stop the application with the option Partial Stop C Suspend running instances.
- C. Suspend any running orchestration service instances.
- D. Stop the application with the option Partial Stop C Allow running instances to continue.

Correct Answer: D

QUESTION 5

You are developing a solution for BizTalk Server 2010. You deploy the solution to the runtime environment. The solution includes one orchestration with a direct bound send port that sends a message to the BizTalk MessageBox database for routing to a folder. After starting the BizTalk application for testing, you notice that the following error is logged in the servers event log: The published message could not be routed because no subscribers were found. This error occurs if the subscribing orchestration or send port has not been enlisted, or if some of the message properties necessary for subscription evaluation have not been promoted. Please use the BizTalk Administration console to troubleshoot this failure. You need to resolve the error without changing the code in the orchestration and without redeploying the solution.

What should you do?

- A. Add a send port that uses the XmlTransmit pipeline.
- B. Add a send port that has a filter that matches the message type.
- C. Add a receive port that uses the XmlReceive pipeline.
- D. Add a dynamic send port.

Correct Answer: B
