QUESTION 1

You are a messaging administrator for a company named Contoso, Ltd. Contoso has a UNIX- based email system for the contoso.com SMTP domain.

Contoso has a perimeter network and an internal network.

Corporate security policy states that only TCP port 25 is allowed from the perimeter network to the internal network.

You plan to change the UNIX-based email infrastructure to Exchange Server 2010 Service Pack 1 (SP1). The UNIX-based infrastructure will not coexist with the Exchange Server 2010 SP1 organization.

Contoso has a partner company named Fabrikam, Inc. All recipients at Fabrikam are hosted on an Exchange Server 2003 organization. Fabrikam uses the fabrikam.com SMTP domain.

You need to plan the configuration of the Exchange Server 2010 SP1 accepted domains to meet the following requirements:

Ensure that all email messages sent to Contoso and Fabrikam can be received by the Contoso servers. Ensure that the Contoso servers can then relay the email messages to the Fabrikam servers. Prevent email messages sent to Fabrikam

recipients from being relayed to the internal network.

What should you include in the plan? (Each correct answer presents part of the solution. Choose all that apply.)

- A. an authoritative accepted domain for contoso.com
- B. an internal relay accepted domain for fabrikam.com
- C. an authoritative accepted domain for fabrikam.com
- D. an external relay accepted domain for contoso.com
- E. an external relay accepted domain for fabrikam.com

Correct Answer: AE

QUESTION 2

You need to recommend a Client Access server design that meets the redundancy requirements of A. Datum. What should you include in the recommendation?

- A. · Four Client Access servers · One hardware load balancer · DNS round robin and subnet prioritization
- B. · Two Client Access arrays · Four Client Access servers · DNS round robin and subnet prioritization
- C. · Two Client Access arrays · Four Client Access servers · Two hardware load balancers
- D. · One Client Access array · Two Client Access servers · One hardware load balancer

Correct Answer: D

QUESTION 3

Your company has a main office and 10 branch offices. You have an Exchange Server 2010 organization. All Exchange servers are installed on virtual machines.

You need to create a monitoring plan for the Exchange servers that meets the following requirements: Identify Exchange server errors Provide alerts when Exchange services are stopped Produce statistical analysis and reporting

Which tool should you include in the plan?

- A. Microsoft System Center Service Manager
- B. Microsoft System Center Operations Manager
- C. Microsoft System Center Configuration Manager
- D. Microsoft System Center Virtual Machine Manager

Correct Answer: B

System Center Operations Manager 2007 R2, Microsoft's end-to-end service-management product, is your best choice for Windows environments. It works seamlessly with Microsoft infrastructure servers, such as Windows Server, and application servers, such as Microsoft Exchange, helping you to increase efficiency while enabling greater control of the IT environment.

QUESTION 4

You have an Exchange Server 2010 organization.

The users access their mailboxes by using Outlook Web App (OWA).

You need to plan a solution to reduce the number of e-mail messages that are accidentally sent to distribution groups that contain company executives.

What should you include in the plan?

- A. custom MailTips
- B. dynamic distribution groups
- C. Outlook Protection Rules
- D. sharing policies

Correct Answer: A

MailTips are informative messages displayed to users while they're composing a message. Microsoft Exchange Server 2010 analyzes the message, including the list of recipients to which it's addressed, and if it detects a potential problem, it

notifies the user with MailTips prior to sending the message. With the help of the information provided by MailTips, senders can adjust the message they're composing to avoid undesirable situations or non-delivery reports (NDRs).

The following unproductive messaging scenarios are common in any messaging environment:

NDRs resulting from messages that violate restrictions configured in an organization such as message size restrictions or maximum number of recipients per message. NDRs resulting from messages sent to recipients that don't exist,

recipients that are restricted, or users whose mailboxes are full. Sending messages to users with Automatic Replies configured. All of these scenarios involve the user sending a message, expecting it to be delivered, and instead receiving a

response stating that the message isn't delivered. Even in the best-case scenario, like the automatic reply, these events result in lost productivity. In the case of an NDR, this scenario could result in a costly call to the Help desk.

There are also several scenarios where sending a message won't result in an error, but can have undesirable, even embarrassing consequences:

Messages sent to extremely large distribution groups.

Messages sent to inappropriate distribution groups.

Messages inadvertently sent to recipients outside your organization. Selecting Reply to All to a message that was received as a Bcc recipient. All of these problematic scenarios can be mitigated by informing users of the possible outcome of

sending the message as they're composing the message. For example, if senders know that the size of the message they're trying to send exceeds the corporate policy, they won't attempt to send the message. Similarly, if senders are

notified that the message they're sending will be delivered to people outside the organization, they're more likely to ensure that the content and the tone of the message are appropriate.

By addressing the scenarios listed earlier, MailTips can help you to:

Reduce the cost of processing and storing messages by preventing NDRs. Reduce the volume of Help desk calls caused by NDRs. Increase productivity by avoiding communications that won't succeed, for example, breaking the cycle of

sending an e-mail message, receiving an automatic reply, and then redirecting the message.

Inform your users as they compose e-mail messages about various policies configured in your organization that impose limits on the messages sent. Direct your users to the correct distribution groups. Reduce the risk of inadvertent

disclosure of information to people outside your organization.

QUESTION 5

You need to add EXSRV02 to host a copy of the Sales public folder and the folders below it. Which command should you run?

A. `AddReplicaToPFRecursive.ps1 -TopPublicFolder`

B. `ReplaceReplicaOnPFRecursive.ps1 -TopPublicFolder "\Sales" -ServerToAdd EXSRV02`

C. AddReplicaToPFRecursive.ps1 -TopPublicFolder "" -ServerToAdd EXSRV02

D. ReplaceReplicaOnPFRecursive.ps1 -TopPublicFolder "\Sales" -ServerToAdd EXSRV02

Correct Answer: A

To add a copy or replica for all public folders for the Sales folder and all folders underneath it, use the included AddReplicaToPFRecursive.ps1 script. The ReplaceReplicaOnPFRecursive.ps1 script removes one server and adds another server.
