QUESTION 1

You create a stored procedure that retrieves all of the rows from a table named Table1.

You need to recommend a solution to ensure that all of the statements in the stored procedure can be executed if another transaction is modifying rows in Table1 simultaneously.

What should you recommend?

- A. Snapshot isolation
- B. A database snapshot
- C. Filegroups
- D. Indexes

Correct Answer: A

Once snapshot isolation is enabled, updated row versions for each transaction are maintained in tempdb. A unique transaction sequence number identifies each transaction, and these unique numbers are recorded for each row version. The

transaction works with the most recent row versions having a sequence number before the sequence number of the transaction.

Newer row versions created after the transaction has begun are ignored by the transaction.

QUESTION 2

You administer a Microsoft SQL Server 2016 database that includes a table named dbo.Log. This table contains millions of records about user activity in an application.

Records in dbo.Log that are more than 90 days old are purged nightly. When records are purged, table locks are causing contention with inserts.

You need to be able to modify dbo.Log without requiring any changes to the applications that utilize dbo.Log.

Which type of solution should you use?

- A. Extended events
- B. Columnstore index
- C. Partitioned tables
- D. Read committed snapshot

Correct Answer: C

QUESTION 3

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while

others might not have a correct solution.

After you answer a question in this sections, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

You have a server named Server1 that has Microsoft SQL Server installed.

Server1 has SQL Server Audit configured to send audit event records to a file.

You need to ensure that a database user named User1 can review the audit data.

Solution: You assign the db_datareader role to User1.

Does this meet the goal?

A. Yes

B. No

Correct Answer: B

Each feature and command for SQL Server Audit has individual permission requirements.

Unless otherwise specified, viewing catalog views requires a principal to have one of the following:

The VIEW SERVER STATE permission.

The VIEW AUDIT STATE permission (gives only the principal access to the sys.server_audits catalog view).

Membership in the sysadmin fixed server role.

The CONTROL SERVER permission.

The ALTER ANY AUDIT permission.

A principal must have the VIEW SERVER STATE or ALTER ANY AUDIT permission to use the Dynamic Management Views.

QUESTION 4

Note: This question is part of a series of questions that use the same or similar answer choices. An answer choice may be correct for more than one question in the series. Each question is independent of the other questions in this series.

Information and details provided in a question apply only to that question.

A company has an on-premises Microsoft SQL Server environment and Microsoft Azure SQL Database instances. The environment hosts a customer database named DB1.

Customers connect to hosted database instances by using line-of-business applications. Developers connect by using

SQL Server Management Studio (SSMS).

You need to grant the developers permission to alter views for DB1 while following the principle of least privilege.

Which permission should you grant?

- A. DDLAdmin
- B. db_datawriter
- C. dbcreator
- D. dbo
- E. View Database State
- F. View Server State
- G. View Definition
- H. sysadmin

Correct Answer: A

To execute ALTER VIEW, at a minimum, ALTER permission on OBJECT is required.

Members of the db_ddladmin fixed database role can run any Data Definition Language (DDL) command in a database.

QUESTION 5

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.

After you answer a question in this sections, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

You have a server named Server1 that has Microsoft SQL Server installed.

Server1 has SQL Server Audit configured to send audit event records to a file.

You need to ensure that a database user named User1 can review the audit data.

Solution: You grant the VIEW SERVER STATE permission to User1.

Does this meet the goal?

- A. Yes
- B. No

Correct Answer: A

Each feature and command for SQL Server Audit has individual permission requirements.

Unless otherwise specified, viewing catalog views requires a principal to have one of the following:

The VIEW SERVER STATE permission.

The VIEW AUDIT STATE permission (gives only the principal access to the sys.server_audits catalog view).

Membership in the sysadmin fixed server role.

The CONTROL SERVER permission.

The ALTER ANY AUDIT permission.

A principal must have the VIEW SERVER STATE or ALTER ANY AUDIT permission to use the Dynamic Management Views.
