QUESTION 1

You need to resolve the identified issues.

Use the drop-down menus to select the answer choice that answers each question based on the information presented in the graphic.

Hot Area:

Answer Area

What setting would you change to reduce the number of execution plans in the plan cache?

Optimize for Ad Hoc workload
Max Degree of Parallelism
Query Wait

What setting would you change to which value to reduce the number of queries which are using parallelism?

Max Degree of Parallelism to 4
Cost Threshold for Parallelism to 50
Locks to 100

Correct Answer:

Answer Area

What setting would you change to reduce the number of execution plans in the plan cache?

Optimize for Ad Hoc workload
Max Degree of Parallelism
Query Wait

What setting would you change to which value to reduce the number of queries which are using parallelism?

Max Degree of Parallelism to 4
Cost Threshold for Parallelism to 50
Locks to 100

From exhibit we see: Cost Threshold of Parallelism: 5 Optimize for Ad Hoc Workloads: false Max Degree of Parallelism: 0 (This is the default setting, which enables the server to determine the maximum degree of parallelism. It is fine.) Locks: 0 Query Wait: -1 Box 1: Optimize for Ad Hoc Workload Change the Optimize for Ad Hoc Workload setting from false to 1/True. The optimize for ad hoc workloads option is used to improve the efficiency of the plan cache for workloads that contain many single use ad hoc batches. When this option is set to 1, the Database Engine stores a small compiled plan stub in the plan cache when a batch is compiled for the first time, instead of the full compiled plan. This helps to relieve memory pressure by not allowing the plan cache to become filled with compiled plans that are not reused.

QUESTION 2

You develop a Microsoft SQL Server 2014 database that contains a heap named OrdersHistorical.

You write the following Transact-SQL query:

INSERT INTO OrdersHistorical

SELECT * FROM CompletedOrders

You need to optimize transaction logging and locking for the statement.

Which table hint should you use?

A. HOLDLOCK

B. ROWLOCK

C. XLOCK

D. UPDLOCK

E. TABLOCK

Correct Answer: E

When importing data into a heap by using the INSERT INTO SELECT FROM statement, you can enable optimized logging and locking for the statement by specifying the TABLOCK hint for the target table.

QUESTION 3

You have a database named DB1 that contains a table named Tabie1. Table1 has a non-clustered index named index1.

You discover that index1 is corrupt.

You need to repair index1.

Which statement should you execute?

A. ALTER INDEX index1 ON table1 REBUILD WITH (ONLINE=0N)

B. DBCC CHECKOB (\\\'db1*, TABLOCK)

C. DBCC CHECKDB (*db1, REPAIR_FAST)

D. DROP INDEX index1 ON tabie1

Correct Answer: A

If REBUILD is performed online (ON) the data in this table is available for queries and data modification during the index operation.

https://docs.microsoft.com/en-us/sql/t-sql/database-console-commands/dbcc-checkdb-transact-sql?view=sqlserver-

QUESTION 4

You have Microsoft SQL Server on a Microsoft Azure virtual machine.

You discover that queries take longer than expected to execute. You also discover that the top wait type for the SQL Server instance is ASYNC_ETWORKJO.

You need to resolve the performance issue.

What should you do?

A. Increase the number of processor cores for the virtual machine.

B. Create any missing indexes.

C. Modify the application code to remove row-by-row processing.

D. Allocate more memory to the SQL Server instance.

Correct Answer: D

QUESTION 5

You create a login named BIAppUser. The login must be able to access the Reporting database.

You need to grant access to the BIAppUser login in the database.

How should you complete the Transact-SQL statements? To answer, drag the appropriate Transact-SQL segments to the correct locations. Each Transact-SQL segment may be used once, more than once, or not at all. You may need to drag
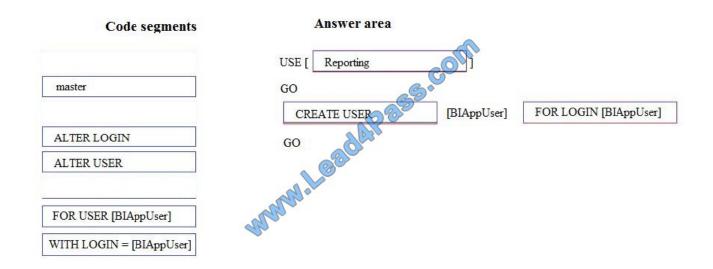

the split bar between panes or scroll to view content.

Select and Place:

Code segments

| Reporting |
| master |
| CREATE USER |
| ALTER LOGIN |
| ALTER USER |
| FOR LOGIN [BIAppUser] |
| FOR USER [BIAppUser] |
| WITH LOGIN = [BIAppUser] |

Answer area

USE [Code segment]
GO

Code segment [BIAppUser] Code segment

GO

Correct Answer:

Code segments

| master |
| ALTER LOGIN |
| ALTER USER |
| FOR USER [BIAppUser] |
| WITH LOGIN = [BIAppUser] |

Answer area

USE [Reporting]
GO

CREATE USER [BIAppUser] FOR LOGIN [BIAppUser]

GO

Box 1: Reporting

The user is to be created in the Reporting database.

Box 2: CREATE USER

Box 3: FOR LOGIN [BIAppUser]

Users are created per database and are associated with logins. You must be connected to the database in where you want to create the user. Here is some sample Transact-SQL that creates a user:

CREATE USER readonlyuser FROM LOGIN readonlylogin;
