-  **100% Money Back** Guarantee
-  **365 Days** Free Update
-  **800,000+** Satisfied Customers

## QUESTION 1

Note: This question is part of a series of questions that use the same scenario. For your convenience, the scenario is repeated in each question. Each question presents a different goal and answer choices, but the text of the scenario is exactly the same in each question in this series.

Start of repeated scenario

You are developing a Microsoft R Open solution that will leverage the computing power of the database server for some of your datasets.

You are performing feature engineering and data preparation for the datasets.

The following is a sample of the dataset.

```
rxGetInfo(df)
head(df)
```

	age	incwage	perwt	wkswork1	state
1	50	9000	30	48	Indiana
2	41	35000	20	48	Indiana
3	55	40400	21	52	Indiana
4	56	45000	30	52	Indiana
5	46	17200	60	52	Indiana
6	49	35000	21	52	Indiana

End of repeated scenario.

You have the following R code.

```
createRandomSample <- function(data)
{
  data$.rxRowSelection <- as.logical(rbinom(length(data[1]), 1.10)) return(data)
}
workers <- file.path(rxGetOption("sampleDataDir"), "Workers.xdf")
df <- rxXdfToDataFrame(file = workers, transformFunc = createRandomSample,
transformVars = "age")
```

Which function determines the variable?

- A. transformVars
- B. rxXdfDataFrame
- C. createRandomSample
- D. transformFunc

Correct Answer: A

---

## QUESTION 2

You are running a large logistic regression for 1,000 feature variables by using the `LogisticRegression()` function in the `MicrosoftML` package. All of the predictor variables are numeric.

Currently, you specify the input variables separately by using the following formula.

`Outcome ~ Feature000 + Feature001 + Feature002 + ... + Feature999`

You discover that it takes 20 minutes to estimate each model.

You need to reduce the amount of time required to estimate each model without losing any information in the predictors.

What should you do?

- A. Use `stepControl()` to perform stepwise regression to limit the number of variables that contribute to the model.
- B. Use `selectFeatures()` to select the features that provide the most information about the outcome variable.
- C. Use `princomp()` on the correlation matrix of Features, and then use only the first 100 principle components to reduce the number of input variables.
- D. Use `concat()` to create a single array variable named Features, and then specify a new formula named `Outcome ~ Features`.

Correct Answer: D

---

## QUESTION 3

You have a dataset that has a character variable. You need to create a bag of counts of n-grams. Which function should you use?

- A. `featurizeText()`
- B. `categoricalHash()`
- C. `concat()`
- D. `selectFeatures()`
- E. `categorical()`

Correct Answer: A

References: <https://docs.microsoft.com/en-us/machine-learning-server/python-reference/microsoftml/featurize-text>

---

## QUESTION 4

Note: This question is part of a series of questions that use the same or similar answer choices. An answer choice may be correct for more than one question in the series. Each question is independent of the other questions in this series.

Information and details provided in a question apply only to that question.

You need to evaluate the significance of coefficients that are produced by using a model that was estimated already.

Which function should you use?

- A. rxPredict
- B. rxLogit
- C. summary
- D. rxLinMod
- E. rxTweedie
- F. stepAic
- G. rxTransform
- H. rxDataStep

Correct Answer: D

References: <https://docs.microsoft.com/en-us/machine-learning-server/r/how-to-revoscaler-linear-model>

---

## QUESTION 5

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while

others might not have a correct solution.

After you answer a question in this sections, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

You use `dplyrXdf`, and you discover that after you exit the session, the output files that were created were deleted.

You need to prevent the files from being deleted.

Solution: You use `dplyrXdf` with the `outFile` parameter and specify a path other than the working directory for `dplyrXdf`.

Does this meet the goal?

- A. Yes
- B. No

Correct Answer: A
