QUESTION 1

You have an on-premises data warehouse that uses Microsoft SQL Server 2016. All the data in the data warehouse comes from text files stored in Azure Blob storage. The text files are imported into the data warehouse by using SQL Server

Integration Services (SSIS). The text files are not transformed.

You need to migrate the data to an Azure SQL data warehouse in the least amount of time possible.

Which two actions should you perform? Each correct answer presents part of the solution.

NOTE: Each correct selection is worth one point.

- A. Use SSIS to upload the files in Azure Blob storage to tables in the Azure SQL data warehouse.
- B. Execute the CREATE EXTERNAL TABLE AS SELECT statement to export the data.
- C. Use AzCopy to transfer the data from the on-premises data warehouse to Azure SQL data warehouse.
- D. Execute the CREATE TABLE AS SELECT statement to load the data.
- E. Define external tables in the Azure SQL data warehouse that map to the existing files in Azure Blob storage.

Correct Answer: DE

QUESTION 2

Note: This question is part of a series of questions that present the same scenario. For your convenience, the scenario is repeated in each question. Each question presents a different goal and answer choices, but the text of the scenario is exactly the same in each question in this series.

Start of repeated scenario

You are migrating an existing on-premises data warehouse named LocalDW to Microsoft Azure. You will use an Azure SQL data warehouse named AzureDW for data storage and an Azure Data Factory named AzureDF for extract, transformation, and load (ETL) functions.

For each table in LocalDW, you create a table in AzureDW.

On the on-premises network, you have a Data Management Gateway.

Some source data is stored in Azure Blob storage. Some source data is stored on an on-premises Microsoft SQL Server instance. The instance has a table named Table1.

After data is processed by using AzureDF, the data must be archived and accessible forever. The archived data must meet a Service Level Agreement (SLA) for availability of 99 percent. If an Azure region fails, the archived data must be available for reading always.

End of repeated scenario.

You need to connect AzureDF to the storage account.

What should you create?

- A. a gateway
- B. a dataset
- C. a linked service
- D. a pipeline

Correct Answer: C

QUESTION 3

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while

others might not have a correct solution. After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

You are troubleshooting a slice in Microsoft Azure Data Factory for a dataset that has been in a waiting state for the last three days. The dataset should have been ready two days ago.

The dataset is being produced outside the scope of Azure Data Factory. The dataset is defined by using the following JSON code.

```
{
  "name": "CustomerTable",
  "properties": {
    "type": "AzureBlob",
    "linkedServiceName": "MyLinkedService",
    "typeProperties": {
      "folderPath": "MyContainer/MySubFolder/",
      "format": {
        "type": "TextFormat",
        "columnDelimiter": ",",
        "rowDelimiter": ";"
      }
    },
    "external": false,
    "availability": {
      "frequency": "Hour",
      "interval": 1
    },
    "policy": {
    }
  }
}
```

You need to modify the JSON code to ensure that the dataset is marked as ready whenever there is data in the data store.

Solution: You add a structure property to the dataset.

Does this meet the goal?

- A. Yes
- B. No

Correct Answer: B

QUESTION 4

Note: This question is part of a series of questions that present the same scenario. For your convenience, the scenario is repeated in each question. Each question presents a different goal and answer choices, but the text of the scenario is

exactly the same in each question in this series.

Start of repeated scenario

You are migrating an existing on-premises data warehouse named LocalDW to Microsoft Azure. You will use an Azure SQL data warehouse named AzureDW for data storage and an Azure Data Factory named AzureDF for extract, transformation, and load (ETL) functions.

For each table in LocalDW, you create a table in AzureDW.

On the on-premises network, you have a Data Management Gateway.

Some source data is stored in Azure Blob storage. Some source data is stored on an on-premises Microsoft SQL Server instance. The instance has a table named Table1.

After data is processed by using AzureDF, the data must be archived and accessible forever. The archived data must meet a Service Level Agreement (SLA) for availability of 99 percent. If an Azure region fails, the archived data must be available for reading always. The storage solution for the archived data must minimize costs.

End of repeated scenario.

You need to define the schema of Table1 in AzureDF.

What should you create?

- A. a gateway
- B. a linked service
- C. a dataset
- D. a pipeline

Correct Answer: C

QUESTION 5

DRAG DROP

You have a Microsoft Azure SQL data warehouse named DW1. Data is loaded to DW1 once daily at 01:00.

A user accidentally deletes data from a fact table in DW1 at 09:00.

You need to recover the lost data. The solution must prevent the need to change any connection strings and must minimize downtime.

Which three actions should you perform in sequence? To answer, move the appropriate actions from the list of actions to the answer area and arrange them in the correct order.

Select and Place:

Actions

Answer Area

- Resume DW1.
- Restore the database to a database named DW2.
- Pause DW2.
- Delete DW1.
- Rename DW2.
- Restore the database to a database named DW1.
- Pause DW1.

Correct Answer:

Actions

Answer Area

- Resume DW1.
-
- Pause DW2.
-
- Restore the database to a database named DW1.
- Pause DW1.
