Following Questions and Answers are all new published by IBM Official Exam Center

QUESTION 1

What is the result of the Tivoli Storage Manager (TSM) server command query filespace?

A. It shows all online filesystems on a user\\'s system.

B. It shows which filespaces the TSM DB is located on.

C. It displays information about filespaces that have been backed up for a client node.

D. It displays the filespaces that are stored inside a backup set from the TSM server client.

Correct Answer: D

The query filespace command displays a list of file spaces for a node that are stored on the Tivoli Storage Manager server, or that are inside a backup set from the Tivoli Storage Manager server, when the backupsetname option is specified.

You can also specify a single file space name to query.

Example: Task

Display your file spaces.

Command: query filespace

QUESTION 2

Which IBM Tivoli Storage Manager server database backup type can be taken offsite?

A. image database backups

B. database snapshot backups

C. differential database backups

D. high availability database backups

Correct Answer: B

Snapshot database backups are typically used for off-site disaster recovery purposes.

Note: When the client backups are complete, the new data in the primary storage pools should be copied to a copy storage pool. The copy storage pool tapes, along with the database backup tapes, should be taken to a secure off-site location or vault. The copy storage pool and database backup tapes are referred to collectively as the off-site backups, and will be used to restore your environment in the event of a catastrophic failure or disaster.

QUESTION 3

What is meant by the server option Dedup Requires Backup?

A. The client must back up deduplicated data.

B. Only copy storage pools can be enabled for deduplication.

C. The database must be backed up prior to deduplication taking place.

D. The duplicated data will be freed after a successful storage pool backup is run.

Correct Answer: D

The DEDUPREQUIRESBACKUP option specifies whether volumes in primary sequential- access storage pools that are set up for deduplication can be reclaimed and whether duplicate data can be discarded before the storage pools are backed up.

QUESTION 4

Disk drives are used for which two types of storage pools?

A. disk storage pool

B. variable access storage pool

C. remote access storage pool when configured as a NAS device class

D. remote access storage pool when configured as a SAN device class

E. sequential access storage pool when configured as a FILE device class

Correct Answer: AD

A: Device Class: Disk Storage volumes that reside on the internal disk drive

Tivoli Storage Manager devices can be physical, such as disk drives and tape drives, or logical, such as files on disk or storage on another server.

D: A NAS is a file server.

Not E: Files on Disk as Sequential Volumes (FILE)

This device type allows you to create sequential volumes by creating files on disk storage. To the server, these files have the characteristics of a tape volume.

QUESTION 5

There are NAS files that need long term archival retention of some but not all files.

Which two actions will resolve this in IBM Tivoli Storage Manager V7.1?

A. Use a CIFS or NFS to mount the NAS volumes.

B. Use the Backup-Archive client with the archive function.

C. Use the NDMP backup function with the archive function.

D. Use the Backup-Archive client with the SNAPDIFF-option.

E. Use the SnapMirror to Tape function to protect the NAS volumes.

Correct Answer: CD

C: File-level backup and restore for NDMP operations When you do a backup via NDMP (network data management protocol), you can specify that the Tivoli Storage Manager server collect and store file-level information in a table of contents (TOC).

If you specify this option at the time of backup, you can later display the table of contents of the backup image. Through the backup-archive Web client, you can select individual files or directories to restore directly from the backup images generated.

D: Snapdiff Using the snapdiff option with the incremental command streamlines the incremental backup process. The command runs an incremental backup of the files that were reported as changed by NetApp instead of scanning all of the volume for changed files

Incorrect:

Not E: SNAPMirror

Specifies that the file system should be copied to a Tivoli Storage Manager storage pool using the NetApp SnapMirror to Tape function. SnapMirror images are block level full backup images of a file system.
