QUESTION 1

Which two of the following indicators are only defined in a property template? (choose two.)

- A. Data type.
- B. Cardinality.
- C. Choice list.
- D. Default value.
- E. Class association.

Correct Answer: AB

QUESTION 2

What is the recommended approach for load balancing an Enterprise JavaBeans (EJB) transport of the Content Engine?

- A. Using a IBM http plugin.
- B. Using a software load balancer.
- C. Using a hardware load balancer.
- D. Using a native Application Server load balancing software.

Correct Answer: D

QUESTION 3

For a new Content Engine server, what information must be provided by the database administrator and recorded in the installation and upgrade worksheet?

- A. GCD and objectstore database names, database port numbers.
- B. GCD and objectstore database names, database user accounts and passwords.
- C. GCD and objectstore database names, database user accounts and passwords, data source names.
- D. GCD and objectstore database names, database port numbers, database user accounts and passwords.

Correct Answer: D

QUESTION 4

What is the primary objective to be considered when implementing a disaster recovery solution for an IBM FileNet

Content manager system?

- A. The ability to resume operations after a large-scale failure while minimizing business data loss.
- B. Maintain data integrity for the GCD, object store databases, storage areas and index data in the event of a disk failure.
- C. Maintain data integrity for the GCD, object store databases, storage areas and indexdata in the event of data corruption or human error.
- D. Provide high availability through redundant hardware and software so that normal operations can continue uninterrupted after a single failure has occurred.

Correct Answer: D

High availability means having redundant hardware and software so that normal operations can continue after a single failure has occurred. Ideally, single failures do not interrupt operations at all, meaning that multiple instances of each component must be operational at alltimes so that the remaining component (or components) can take over the fullload when any one component fails. In hardware devices, redundancy can be achieved by having redundant components within a single unit, or by having more than one unit installedand operational. If software redundancy is achieved by running the software simultaneously on more than one hardware device, the configuration is called active/active, because both components, or both units, are active at the same time. For this approach to be effective, the remaining components must be able handle the entire workload if a single component fails. The alternative approach for high availability is an active/passive configuration, in which the redundant component is not in use during normal operations but can be brought online if the component it is backing up fails.

QUESTION 5

The Content Engine bootstrap account (ce_bootstrap_admin) is stored in the CEMPBoot.properties file that is archived in the Content Engine EAR file. What type of account should you use for the ce_bootstrap_admin?

- A. Database account.
- B. Directory server account.
- C. Application server account.
- D. Operating system account.

Correct Answer: B
