QUESTION 1

An integration developer is designing an XML map and must update a particular value in the target to a fixed value that is not dependent on the source.

What would be the most appropriate transform type for this situation?

A. Set

B. Move

C. Append

D. Assign

Correct Answer: C

QUESTION 2

In the event of an error occurring in a mediation flow, the integration developer has a requirement that failure information is logged to a database. To do this, the developer uses the Message Logger primitive with its default settings. During testing of the application, the database administrator notices that over time these logged error messages are taking up large amounts of disk space. The amount of space needed for each logged message needs to be reduced. How should the developer BEST resolve this issue?

A. Create a Business Object to hold just the failure information and pass it to the Message Logger primitive.

B. Log just the failure information by modifying the properties in the Details tab of the Message Logger primitive.

C. Use a custom primitive to extract the failure information and pass it to the Message Logger primitive.

D. Use a filter primitive to filter out just the failure information, then pass it to the Message Logger primitive

Correct Answer: B

QUESTION 3

In which of the following headers of the Service Message Object (SMO) is the Flat File Adapter binding related information located?

A. EISHeader

B. HTTPHeader

C. SMOHeader

D. WSAHeader

Correct Answer: A

QUESTION 4

According to SOA principles, which of the following BEST describes the interaction between services?

A. Services are integrated and mediated by service modules.

B. Services are integrated and mediated by an enterprise service bus.

C. Services directly interact with each other through references.

D. Services intercept and modify messages as they are passed between providers and requesters.
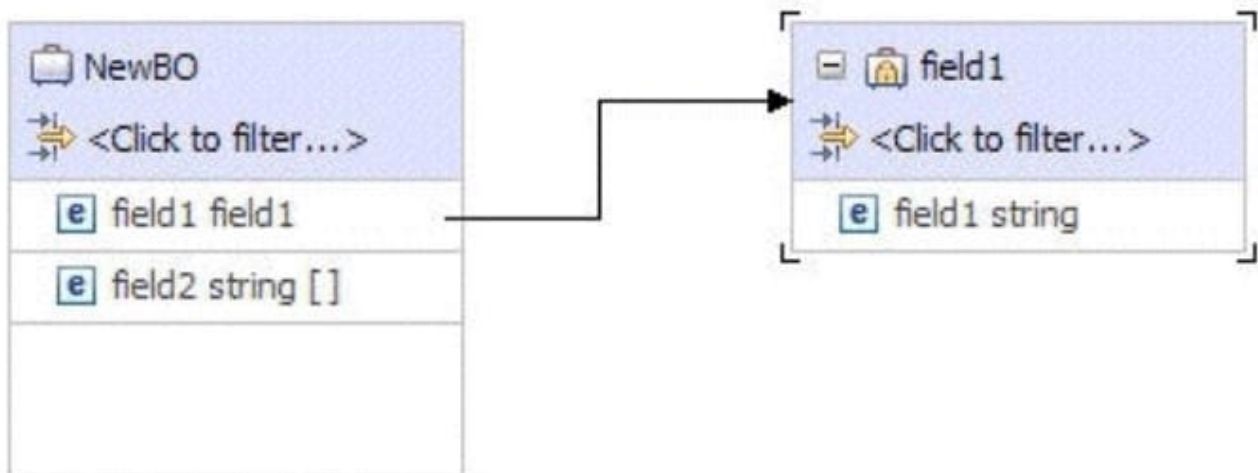

Correct Answer: B

QUESTION 5

An integration developer is working with a set of business objects using the business object editor and notices a lock mark associated with a business object.

What does the lock mark associated with the field business object in the Exhibit indicate?

A. The fieldl business object is private.

B. The fieldl business object is abstract.

C. The fieldl business object has not been defined.

D. The fieldl business object is invalid because the object name conflicts with the attribute name.

Correct Answer: A
