**QUESTION 1**

Given: A WLAN consultant has just finished installing a WLAN controller with 15 controller- based APs.

Two SSIDs with separate VLANs are configured for this network, and both VLANs are configured to use the same RADIUS server. The SSIDs are configured as follows:

SSID Blue - VLAN 10 - Lightweight EAP (LEAP) authentication - CCMP cipher suite  
SSID Red - VLAN 20 PEAPv0/EAP-TLS authentication - TKIP cipher suite

The consultant's computer can successfully authenticate and browse the Internet when using the Blue SSID. The same computer cannot authenticate when using the Red SSID.

What is a possible cause of the problem?

- A. The Red VLAN does not use server certificate, but the client requires one.
- B. The TKIP cipher suite is not a valid option for PEAPv0 authentication.
- C. The client does not have a proper certificate installed for the tunneled authentication within the established TLS tunnel.
