100% Passing Guarantee
100% Money Back Assurance

Following Questions and Answers are all new published by HP Official Exam Center

-  **Instant Download** After Purchase
-  **100% Money Back** Guarantee
-  **365 Days** Free Update
-  **800,000+** Satisfied Customers

QUESTION 1

What is a use case for tunneling traffic between an Aruba switch and an Aruba Mobility Controller (MC)?

- A. applying firewall policies and deep packet inspection to wired clients
- B. enhancing the security of communications from the access layer to the core with data encryption
- C. securing the network infrastructure control plane by creating a virtual out-of-band- management network
- D. simplifying network infrastructure management by using the MC to push configurations to the switches

Correct Answer: A

QUESTION 2

Your Aruba Mobility Master-based solution has detected a rogue AP. Among other information, the ArubaOS Detected Radios page lists this information for the AP SSID = PublicWiFi:

BSSID = a8M27 12 34:56 Match method = Exact match Match type = Eth-GW-wired-Mac-Table

The security team asks you to explain why this AP is classified as a rogue. What should you explain?

- A. The AP is connected to your LAN because it is transmitting wireless traffic with your network's default gateway's MAC address as a source MAC. Because it does not belong to the company, it is a rogue.
- B. The AP has a BSSID that matches authorized client MAC addresses. This indicates that the AP is spoofing the MAC address to gain unauthorized access to your company's wireless services, so it is a rogue.
- C. The AP has been detected as launching a DoS attack against your company's default gateway. This qualifies it as a rogue which needs to be contained with wireless association frames immediately.
- D. The AP is spoofing a router's MAC address as its BSSID. This indicates that, even though WIP cannot determine whether the AP is connected to your LAN, it is a rogue.

Correct Answer: D

QUESTION 3

What is a benefit of deploying Aruba ClearPass Device Insight?

- A. Highly accurate endpoint classification for environments with many device types, including Internet of Things (IoT)
- B. visibility into devices' 802.1X supplicant settings and automated certificate deployment
- C. Agent-based analysis of devices' security settings and health status, with the ability to implement quarantining
- D. Simpler troubleshooting of ClearPass solutions across an environment with multiple ClearPass Policy Managers

Correct Answer: B

QUESTION 4

You have deployed a new Aruba Mobility Controller (MC) and campus APs (CAPs). One of the WLANs enforces 802.1X authentication to Aruba ClearPass Policy Manager (CPPM). When you test connecting the client to the WLAN, the test fails. You check Aruba ClearPass Access Tracker and cannot find a record of the authentication attempt. You ping from the MC to CPPM, and the ping is successful.

What is a good next step for troubleshooting?

- A. Renew CPPM's RADIUS/EAP certificate
- B. Reset the user credentials
- C. Check CPPM Event viewer.
- D. Check connectivity between CPPM and a backend directory server

Correct Answer: C

QUESTION 5

You configure an ArubaOS-Switch to enforce 802.1X authentication with ClearPass Policy Manager (CPPM) defined as the RADIUS server. Clients cannot authenticate. You check Aruba ClearPass Access Tracker and cannot find a record of the authentication attempt.

What are two possible problems that have this symptom? (Select two)

- A. users are logging in with the wrong usernames and passwords or invalid certificates.
- B. Clients are configured to use a mismatched EAP method from the one in the CPPM service.
- C. The RADIUS shared secret does not match between the switch and CPPM.
- D. CPPM does not have a network device defined for the switch's IP address.
- E. Clients are not configured to trust the root CA certificate for CPPM's RADIUS/EAP certificate.

Correct Answer: AE
