**QUESTION 1**

A 4-year-old client is unable to go to sleep at night in the hospital.

Which nursing intervention best promotes sleep for the child?

- A. turning out the room light and closing the door
- B. tiring the child during the evening with play exercises
- C. identifying the child's home bedtime rituals and following them
- D. encouraging visitation by friends during the evening

Correct Answer: C

Preschool-age children require bedtime rituals that should be followed in the hospital if possible.

Turning out the room light and closing the door increases a child's fear.

Tiring the child during the evening with play exercises and encouraging visitation by friends during the evening do not promote sleep.

---

**QUESTION 2**

The intent of the Patient Self Determination Act (PSDA) of 1990 is to \_\_\_\_\_.

- A. enhance personal control over legal care decisions
- B. encourage medical treatment decision making prior to need
- C. give one federal standard for living wills and durable powers of attorney
- D. emphasize client education

Correct Answer: B

The purpose of the PSDA is to promote decision-making prior to need. Choices "enhance personal control over legal care decisions", "give one federal standard for living wills and durable powers of attorney" and "emphasize client education" are incorrect. The focus of the PSDA is individual health care decision-making. A federal standard for advance directives does not exist. Each state has jurisdiction regarding these policies and protocols.

**QUESTION 3**

The LPN is taking care of a female patient with a cesium implant.

Which statement made by the nurse would be accurate?

- A. "Vaginal stenosis may occur as a result of this treatment."

- B. "As long as you are comfortable, sexual intercourse may continue as normal during your treatment."
- C. "You will likely feel hungrier than usual as a result of this treatment."
- D. "Constipation frequently occurs as a result of having a cesium implant."

Correct Answer: A

---

**QUESTION 4**

A client with a pleural drainage system to suction has gentle bubbling of the water seal.

What should the nurse do?

- A. Notify the physician.
- B. Clamp the chest tube.
- C. Replace the system.
- D. Document the finding.

Correct Answer: D

Gentle bubbling is a normal finding for the client who has a pleural drainage system to suction, so it simply needs to be documented. If the bubbling becomes vigorous, it could indicate a leak, which the nurse needs to investigate.

The remaining choices are not necessary.

---

**QUESTION 5**

An LPN is working on the care plan for a patient with diabetes mellitus.

Which of these outcomes would be the most appropriate?

- A. The patient will maintain a blood glucose level within normal limits throughout my shift.
- B. The patient will maintain a blood glucose level within the normal range of 70-110 (per facility policy).
- C. The patient will maintain a blood glucose level within normal range limits today.
- D. The patient will maintain a blood glucose level within the normal range of 70-110 (per facility policy) throughout my shift.

Correct Answer: D
