QUESTION 1

You want to deploy the generated code manually in a source or target server, before executing a mapping in ODI.

How can you accomplish this? (Choose the best answer.)

- A. You need not deploy the generated code manually in a source or target server. ODI Agent coordinates the execution of commands prepared for the job, and executes them on the correct server.
- B. You must deploy the generated code manually in a source or target server. You must then compile the generated code and then double-check if the code prepared for the development server is the same as the code for the production server.
- C. You need not deploy the generated code manually in a source or target server. ODI prepares a package for the development environment.
- D. You must deploy the generated code manually in a source or target server. You must copy all procedures generated into the development, test, and production servers.

QUESTION 2

You are defining a data store in ODI metadata and want to add a primary key even if it does not physically exist on the related database catalog.

How can you accomplish this? (Choose the best answer.)

- A. You can add a primary key even if it does not physically exist on the related database catalog, by adding constraints on the data store.
- B. You can add a primary key even if it does not physically exist on the related database catalog, by adding constraints to the data store diagram.
- C. You cannot add a primary key if it does not physically exist on the related database catalog. You can flag only non-null conditions to be checked.
- D. You cannot add a primary key if it does not physically exist on the related database catalog. You can reverse engineer only the existing constraints.
