Correct Answer: C

QUESTION 7

Given the source code for an AWS Lambda function in the local file store, py containing a handler function called `get_store` and the following AWS CloudFormation template:

```
Transform: AWS::Serverless-2016-10-31
Resources:
  StoreFunc:
    Type: AWS::Serverless::Function
    Properties:
      Handler: store.get_store
      Runtime: python3.6
```

What should be done to prepare the template so that it can be deployed using the AWS CLI command `aws cloudformation deploy`?

- A. Use `aws cloudformation compile` to base64 encode and embed the source file into a modified CloudFormation template.
- B. Use `aws cloudformation package` to upload the source code to an Amazon S3 bucket and produce a modified CloudFormation template
- C. Use `aws lambda zip` to package the source file together with the CloudFormation template and deploy the resulting zip archive
- D. Use `aws serverless create-package` to embed the source file directly into the existing CloudFormation template

Correct Answer: B

QUESTION 8

Which of the following is an AWS Cloud architecture design principle?

- A. Implement single points of failure.
- B. Implement loose coupling.
- C. Implement monolithic design.
- D. Implement vertical scaling.

Correct Answer: B

Loose coupling between services can also be done through asynchronous integration. It involves one component that generates events and another that consumes them. The two components do not integrate through direct point-to-point interaction, but usually through an intermediate durable storage layer. This approach decouples the two components and introduces additional resiliency. So, for example, if a process that is reading messages from the queue fails, messages can still be added to the queue to be processed when the system recovers.
